stormed their camp on 30th Nov., 1700, with 8,000 Swedes, and defeated them with great slaughter. He next dethroned Augustus II., and procured the election of Stanislaus Leszczyński as king of Poland. Augustus supposed himself safe at least in Saxony, his hereditary dominion, but was followed thither, and humbling terms of peace were dictated at Altranstädt in 1706. C. obtained from the emperor liberty of conscience for the Protestants of Silesia. Leaving Saxony with an army of 43,000 men in Sept., 1707, he proposed to advance direct upon Moscow; but at Smolensk he was induced, by the representations of the Cossack *hetman*, Mazeppa, to change his plan and proceed to the Ukraine, in hope of being joined by the Cossacks. In this hope, however, he was disappointed, and after enduring many hardships, he was defeated by the Russians at Pultowa, on the 8th of July, 1709, and fled to Bender in the Turkish dominions.

Augustus II. now revoked the treaty of Altranstädt, and the czar and the king of Denmark assailed the Swedish territories. But the regency in Stockholm adopted measures of effective and successful resistance, and C. prevailed with the porte to declare war against Russia, in which Peter seemed at first likely to have suffered a severe defeat. But Russian agents succeeded in inspiring the Turks with suspicions concerning the ultimate designs of C., who was conveyed to Adrianople, but after some time escaped, and made his way through Hungary and Germany, pressing on by day and night with extraordinary speed till he reached Stralsund, where he was received with great joy, on 11th (22d) Nov., 1714. He was soon, however, deprived of Stralsund by the allied Danes, Saxons, Prussians, and Russians. After he had adopted measures for the security of the Swedish coasts, his passion for war led him to attack Norway. Success appeared again to attend his arms, when, in the siege of Friedrichshald, on 30th Nov., 1718, he was killed by a musket-bullet. On his death, Sweden—exhausted by his wars—ceased to be numbered among the great powers. He was a man capable of comprehensive designs, and of great energy in prosecuting them. His abilities appeared not merely in military affairs, but in his schemes for the promotion of trade and manufactures. His self-willed obstinacy, however, amounted almost to insanity; in fact, he has been termed “a brilliant madman.” His habits were exceedingly simple: in eating and drinking, he was abstemious; and in the camp, he sought no luxuries beyond the fare of the common soldier.

CHARLES XIII., King of Sweden (1809–1818), b. Oct. 7, 1748, was the second son of king Adolphus Frederick, and of the sister of Frederick the Great of Prussia. He was trained for naval command, and was long the high admiral of Sweden, in which capacity he distinguished himself by a great victory over the Russians in the gulf of Finland in 1788, and by bringing back his fleet safe to Carlsrona in the most perilous season of the year. He was on several very important occasions called to an active part in political affairs—in the revolution of 1772, when he was made governor-general of Stockholm and duke of Södermanland; after the assassination of his brother Gustavus III. in 1792, when he was placed at the head of the regency; and after the revolution of 1809, when he became administrator of the kingdom, and subsequently king. The Swedish monarchy now became limited instead of despotic. Having no child, C. concurred with the states of the kingdom in choosing as his successor the French general, Bernadotte, who became crown-prince of Sweden, and ascended the throne on the death of C., Feb. 5, 1818. The prudence of the king and crown-prince secured the union of Norway with Sweden in 1814, as a compensation for Finland.

CHARLES XIV., King of Sweden and Norway (1818–1844), originally JEAN BAPTISTE JULES BERNADOTTE, was b. at Pau, in the s. of France, Jan. 26, 1764. He was the son of a lawyer. He entered the French army as a common soldier; became an ardent partisan of the revolution; greatly distinguished himself in the wars of Napoleon, and soon attained the highest military rank. But he was distrusted by Bonaparte, whose ambitious schemes he took no part in promoting; and Napoleon having taken offense at his conduct after the battle of Wagram, Bernadotte left the army in disgust, and returned to Paris. He was afterwards sent by the ministerial council to oppose the British, who had landed at Walcheren, but the breach between the emperor and him grew wider. In 1810, he was elected crown-prince, and heir to the throne of Sweden. Almost the only condition imposed on him was that of joining the Protestant church. He changed his name to Charles John; and the health of the Swedish king, Charles XIII., failing in the following year, the reins of government came almost entirely into his hands. He refused to comply with the demands of Napoleon, which were opposed to the interests of Sweden, particularly as to trade with Britain, and was soon involved in war with him. He commanded the army of the allies in the n. of Germany, and defeated Oudinot at Grossbeeren, and Ney at Dennewitz. He showed great reluctance, however, to join in the invasion of France, and was tardy in his progress southward.—He became king of Sweden on the death of Charles XIII., Feb. 5, 1818. He won for himself the character of a wise and good king. Education, agriculture, manufactures, commerce, and great public works, as well as the military strength of the kingdom, were promoted by his care. He died Mar. 8, 1844, and was succeeded by his son Oscar.

CHARLES XV., 1826–72; King of Sweden and Norway, succeeding his father, Oscar I., who was a son of Charles XIV. The rule of C. was liberal and popular. The most important event was the change (in 1866) in the constitution of the parliament,

which from that time has consisted not of four, but of two chambers, one elected by the provincial representatives and the other by the people. Charles's kindly nature was shown in his firm refusal to sanction capital punishment. He had a taste for literature and art, and published a volume of poems. In 1850, he married Louisa, daughter of the king of the Netherlands, by whom he had one daughter, who became the wife of prince Frederick of Denmark.

CHARLES, Archduke of Austria, third son of the emperor Leopold II., was b. at Florence, 5th Sept., 1771. Whilst yet a youth, he pursued military studies with much ardor; and after having greatly distinguished himself as a gen. in inferior commands, he was intrusted, in 1796, with the chief command of the Austrian army on the Rhine. He fought with great success against Moreau at Rastadt, defeated Jourdan in several battles, drove the French over the Rhine, and concluded his victories by taking Kehl in the winter. In 1799, he was again at the head of the army on the Rhine, was several times victorious over Jourdan, protected Swabia, and successfully opposed Massena. In 1800, bad health compelled him to retire from active service; but being appointed gov. gen. of Bohemia, he formed a new army there. After the battle of Hohenlinden, he was again called to the chief command, and succeeded in staying the rapid progress of Moreau, but almost immediately entered into an armistice with him, which was followed by the peace of Luneville. In 1805, he commanded the army opposed to Massena in Italy, and fought the hard battle of Caldiero; but upon bad tidings from Germany, retreated from the left bank of the Adige to Croatia. This retreat was one of his greatest military achievements. In 1809, he won the great battle of Aspern, which first showed to Europe that Napoleon was not invincible; but he did not promptly enough follow up his victory, and Napoleon, who hastened to reinforce his army, retrieved his fortunes at Wagram, and the archduke was now compelled to give way before the enemy, till he reached Znaim, where an armistice was concluded on 12th July. In the campaigns of 1813 and 1814 he had no part; and lived in retirement till his death, 30th April, 1847. He was author of *Principles of Strategy* (1814).

CHARLES, ELIZABETH RUNDLE, b. Jan. 2, 1828; the wife of Andrew P. Charles, of London. She wrote *Chronicles of the Schönberg-Cotta Family*; *Diary of Mrs. Kitty Trevelyan*, and other popular works of fiction. She d. in 1896.

CHARLES, JACQUES ALEXANDRE CÉSAR, 1746-1823; a French physicist, noted for skill in experiments and public demonstrations. He made the first balloon to hold hydrogen gas, with which a successful ascent was made. He was the inventor of a number of optical instruments.

CHARLES ALBERT, King of Sardinia (1831-49), b. 2d Oct., 1798, was the son of the prince Charles Emmanuel of Savoy-Carignan, and in 1800, succeeded to his father's title and estates in France and Piedmont. In 1817, he married Maria Theresa, daughter of the archduke Ferdinand of Tuscany. When the revolutionary movement took place in Piedmont in 1821, he was made regent, upon the abdication of Victor Emmanuel, until Charles Felix, the brother of the late king, should arrive to assume the sovereignty. He displeased both the liberal party and their opponents, and Charles Felix disallowed all his acts, and for some time forbade his appearance at court. In 1829, he was appointed viceroy of Sardinia. On the death of Charles Felix, 27th April, 1831, he ascended the throne. The liberals had great expectations from him, but were for a long time disappointed; his government much resembled the other Jesuitic and despotic Italian governments, except that he sought to promote the interests of the country, and to restrict the influence of the clergy in political affairs. It was not till after the elevation of Pius IX. to the papedom, when a new impulse was given to the cause of reform, that the Sardinian government adopted the constitutional and liberal policy to which it has since adhered. C. A. entered warmly into the project of Italian unity, and evidently expected to place himself at the head of the whole movement and of the new kingdom of Italy. When the Lombards and Venetians rose against the Austrian government, he declared war against Austria, 23d Mar., 1848, and at first was exceedingly successful, but was insufficiently supported by the Lombards, and finally defeated by the Austrians; so that after the fatal battle of Novara, 23d Mar., 1849, he was obliged, for the preservation of the integrity of his kingdom, to resign the crown in favor of his son, Victor Emmanuel. He afterwards retired to Portugal, and died at Oporto on 28th July of the same year.

CHARLES AUGUSTUS, 1757-1828, Grand Duke of Saxe-Weimar. He assumed the government in his eighteenth year, and the next year entered the Prussian army, in which he remained until the defeat at Jena in 1806, when he became a member of the Rhenish confederacy and furnished aid to the French. In 1813, he joined in the coalition against Napoleon, and took command of an army of Saxons, Hessians, and Russians. He fought among the allies in 1815, and the congress of Vienna rewarded his services by enlarging his principality and making it a grand duchy. Charles was an intimate friend of Goethe, Wieland, and other men of letters.

CHARLES THE BOLD, Duke of Burgundy (1467-77), son of Philip the Good, of the house of Valois, and of Isabella of Portugal, was b. at Dijon on 10th Nov., 1433, and bore, during his father's life, the title of count of Charolais. He was of a fiery, ambitious, and violent

disposition. From an early period to the end of his life he was a declared enemy of Louis XI. of France, the nominal feudal superior of Burgundy. Louis having caused Philip to deliver up some towns on the Somme, C. left his father's court and formed an alliance with the duke of Bretagne and some of the great nobles of France for the maintenance of feudal rights against the crown. Their forces ravaged Picardy and Isle-de-France, they threatened Paris, and defeated the king at Monthéry. The result was a treaty by which the count of Charolais obtained the towns on the Somme and the counties of Bologne, Guines, and Ponthieu for himself. In 1467, he succeeded his father as duke of Burgundy. Richer and more powerful than any prince of that time, he conceived the design of restoring the old kingdom of Burgundy, and for this purpose of conquering Lorraine, Provence, Dauphiny, and Switzerland. Whilst he was making preparations for war, Louis invited him to a conference; he hesitated, and Louis by his agents stirred up the citizens of Liege to revolt. Meanwhile C. consented to the conference, and the news coming of what had taken place at Liege, he seized the king, and if he had not been withheld by his counselor Comines, would have put him to death. He compelled Louis, however, to accompany him to Liege, and apparently to sanction the cruelties which he inflicted on the citizens. War raged between them afterwards with but little intermission till 1475. In Sept. of that year, C. found himself at leisure to attempt the prosecution of his favorite scheme of conquest, and soon made himself master of Lorraine. In the following year he invaded Switzerland, stormed Grandson, and hanged and drowned the garrison; but was soon after terribly defeated by the Swiss near that place, and lost his baggage and much treasure. Three months after, he appeared again in Switzerland with a new army of 60,000 men, and laid siege to Morat, where he sustained, on June 22, 1476, another and more terrible defeat. After this he sank into despondency, and let his nails and beard grow. But the news that the young duke René of Lorraine was attempting to recover his territories, roused him, and he laid siege to Nancy. His army was small; Italian auxiliaries, whom he had hired, went over to the enemy; and in the battle which he too rashly fought, he lost his life, Jan. 5, 1477. His daughter and heiress, Maria, married the emperor Maximilian I. With his life ended the long successful resistance of the great French vassals to the central power of the monarchy.

CHARLES CITY, a co. in s.e. Virginia, on the James and Chickahominy rivers; 200 sq.m.; pop. '90, 5066, incl. colored. Productions, corn, wheat, oats, etc. Co. seat, Charles City.

CHARLES EMMA NUEL I., duke of Savoy (1580-1630), called the Great, was b. at the castle of Rivoli, 12th Jan., 1562, and succeeded his father Emmanuel Philibert in 1580. He married a daughter of Philip II. of Spain, and at first allied himself politically with Spain, and made war against France for the marquise of Saluzzo (or Saluces), which he obtained in 1601, upon the cession of some other territories to France. But he afterwards joined France and Venice to oppose the preponderant power of Spain in Italy; then allied himself with the house of Hapsburg, and set up a claim to Montferrat, but suffered, in consequence, the direst calamities, great part of his dominions being conquered by the French, and in their hands when he died, 26th July, 1630. He was a prince of vast ambition, and for whom no enterprise was too bold.

CHARLES, surnamed **MARTEL**—i.e., the hammer—was the son of Pepin of Heristal, mayor of the palace under the last Merovingian kings, and was b. about 690 A.D. After his father's death in 714, he was proclaimed mayor of the palace by the Austrasian party. King Chilperic and he now quarreled, and a civil war arose which ended in C. becoming undisputed mayor of the palace and ruler of the Franks. During the latter years of his life, he indeed allowed the nominal throne to remain occupied—the titular kings being mere puppets in his hands. He was much engaged in wars against the revolted Alemanni and Bavarians, the Saxons, etc., but his importance as a historic personage is chiefly due to his wars against the Saracens, who, having conquered Septimania from the western Goths in 720, advanced thence into Aquitaine, conquered Bordeaux, defeated the duke of Aquitaine, crossed the Garonne, advanced to the Loire, and threatened Tours. C. defeated them between Tours and Poitiers in 732 in a great battle, in which their leader, Abd-ur-Rahmán, fell, and a stop was put to their progress in Europe, which had filled all Christendom with alarm. He defeated them again in 738, when they had advanced in the Burgundian territories as far as Lyon; deprived them of Languedoc, which he added to the kingdom of the Franks; and left them nothing of their possessions n. of the Pyrenees beyond the river Aude. He died on the 22d Oct., 741, at Quiercy on the Oise, in the midst of his victories, his projects, and his greatness, leaving the government of the kingdom to be divided between his two sons—Carloman, and Pepin the Short.

CHARLES MIX, a co. in s.e. S. Dakota, on the Missouri river; formed 1862; organized in 1879. Co. seat, Wheeler. Area, 1130 sq.m.; pop. '90, 4178.

CHARLES RIVER, a stream rising in Central Massachusetts, and flowing easterly to Boston harbor. It affords valuable water-power in many places, and in its lower course its banks are lined with large and small manufacturing villages.

CHARLES'S WAIN, a common name for the constellation of Ursa Major (q.v.).

CHARLESTON, a co. in s.e. South Carolina on the ocean, and including several islands; 193 sq.m.; pop. '90, 59,903, includes colored. The Santee river is the n. e. border, and the Ashley, Edisto, and Cooper rivers intersect the co. The surface is low and level, and much of the soil is very rich, producing sea-island and short staple cotton, rice, corn, sweet potatoes, etc. The Atlantic Coast Line, the Plant System, and the South Carolina and Georgia railroads intersect. Co. seat, Charleston.

CHARLESTON, city and co. seat of Coles co., Ill., on the Cleveland, Cincinnati, Chicago and St. Louis, and the Toledo, St. Louis, and Kansas City railroads; 48 m. w. of Terre Haute. It has a State normal school, churches, national banks, and newspapers, and manufactures flour, woollens, iron, etc. Pop. '90, 4135.

CHARLESTON, city, port of entry, and co. seat of Charleston co., South Carolina; the largest city of the state, and one of the chief seaports of the Southern States; at the confluence of the Ashley and Cooper Rivers, about 6 miles from the ocean; lat. $32^{\circ} 47'$ n.; long. $79^{\circ} 57'$ w.; 100 miles s.s.e. of Columbia; 82 miles n.e. of Savannah.

HISTORY.—In 1669 an English colony landed at Port Royal, but removed the next year, and founded Charles Town, on the west bank of the Ashley River, 3 miles above the present city. In 1680 the town was transferred to the peninsula between the Ashley and Cooper Rivers. In 1685–6 many Huguenot refugees settled in Charleston, but its growth was slow until the development of the cotton trade. In 1755, 1200 exiles from Acadia settled in Charleston, and in 1793, 500 French refugees from San Domingo. At the time of the Revolution, Charleston was one of the chief cities of America, and was the first Southern city that entered into the revolutionary movements of 1775. June 28, 1776, the garrison on Sullivan's Island, commanded by Colonel Moultrie, repulsed an attack by a British fleet, but the city was captured by Sir Henry Clinton, May 12, 1780, after an obstinate defense. Charleston was incorporated in 1783, and was the capital of the state till 1790. It was the centre of the nullification movement of 1832, and the first open action in favor of secession was taken here, in the Declaration of Secession, December 20, 1860. Fort Sumter was bombarded and taken by the Confederates, April 12–13, 1861. In 1863, a Federal fleet, under Admiral Dupont, attacked the fortifications in the harbor, but without success, and the city remained in possession of the Confederates until the surrender of Columbia to General Sherman, February 17, 1865, when it was evacuated, and all the public buildings, stores, cotton-warehouses, and shipping were fired by order of General Hardee, the Confederate commander. The Union forces took possession February 18. During the war many buildings were destroyed, and the towers and steeples of the churches riddled with shot and shell. Between 1860 and 1865 commerce was utterly ruined, and not until a year after the peace was the city again made a port of entry. Charleston was damaged by a cyclone, August 25, 1885; and on the night of August 31, 1886, one-half the city was destroyed by a severe earthquake, with a loss exceeding \$5,000,000.

TOPOGRAPHY.—Charleston is a beautiful old town, with picturesque houses, adorned with vine-covered balconies, and surrounded generally by semi-tropical gardens. It lies on a peninsula three miles long and about one and a half miles wide. At the extremity is the beautiful Battery, situated like that of New York, a broad esplanade, 1500 feet long, with a good view of the harbor and the forts. Facing it is a curving row of beautiful residences, both old and new. West of the Battery is White Point Garden, on Battery Square, shaded by fine live-oaks, and containing the Jasper Monument, commemorating the gallant act of the Revolutionary hero, and the bronze bust of Wm. Gilmore Simms, the Southern novelist. Meeting Street, the principal business street, extends from the Garden to the railroad station. The lower portion is lined with fine private houses, embowered in roses and myrtles. At its intersection with Broad Street is a group of public buildings: the Court House and the new Post Office on the left, and on the right the City Hall, containing some valuable portraits, and St. Michael's Church, built in 1752–61. It resembles St. Martin's-in-the-fields, London, and is the most beautiful Colonial church in America. In the lofty tower is a fine set of chimes, brought from England in 1764. The church was nearly destroyed by the earthquake in 1886. On the upper part of Meeting Street is Marion or Citadel Square, containing a statue of John C. Calhoun, the famous South Carolina statesman. On the north side of the square is the South Carolina Military Academy, usually known as the Citadel. On the next street east, Church Street, is St. Philip's Church, similar in style to St. Michael's. It is the third building, but is a copy of the church destroyed in 1835. The churchyard contains Calhoun's grave. On a side street, near Church Street, stands the interesting old Huguenot church, the only one in America still using a translation of the French liturgy, published at Neufchatel in 1737. On East Bay is the old pre-Revolutionary post office, and the handsome new marble Custom House, which cost \$3,000,000.

INSTITUTIONS, ETC.—The most prominent charitable institutions are the Orphan House, founded in 1792, and said to be the oldest institution of the kind in America; the Enston Home for the Aged, consisting of a group of forty cottages and a church; the Home for Widows and Daughters of Confederate Soldiers, the City Hospital, and Roper Hospital. There are 60 churches and 2 synagogues. The most prominent churches besides St. Michael's and St. Philip's are the handsome Circular Church (Congrega-

tional), and St. Finbar's Cathedral, rebuilt in 1890. Charleston has a high school and several public schools; the Avery Normal Institute for colored teachers and Wallingford Academy for colored youth; and the Porter Manual Training Institute. The higher educational institutions are Charleston College, founded in 1785, which contains a fine museum, the South Carolina Medical College, and the South Carolina Military Academy, whose cadets fired the first shot in the Civil War from a battery on Morris Island against the *Star of the West*, Jan. 9, 1861. The libraries are the Charleston, founded in 1748, the Apprentices', and the Minors'. The principal clubs are the Charleston Club, the Carolina Yacht Club, the Queen City Club and the St. Cecilia Society, founded about 1762, and probably the oldest social organization in the country, and the most exclusive in Charleston. The principal park is White Point Garden. The Park in front of the City Hall contains a statue of William Pitt, erected in 1770; the right arm was shot off by the British in 1780. At the west end of Broad Street is a popular resort, skirting an inlet of the Ashley River. Marion Square is used as a parade-ground, and in the north-western part of the city is Washington Race-course, opened in 1792. Sullivan's Island has a fine beach, and is a favorite summer resort. Two bridges over the Ashley River give access to the suburbs, which abound in picturesque scenery and in places of interest. One of the chief attractions is the Gardens of Magnolia, containing superb magnolia bushes, sometimes fifteen to twenty feet high, and also fine magnolias and japonicas. Another point of interest is the Church of St. James, Goosecreek, built in 1711, and near it is a superb avenue of oaks, two hundred years old. North of the city, three miles from the City Hall, is the beautiful Magnolia Cemetery, famous for its azaleas, magnolias, camelias, and fine live-oaks, the trunk of one having a girth of eighteen feet.

HARBOR.—The harbor, formed by the junction of the Ashley and Cooper Rivers, has an average width of two miles and a depth of forty feet at the city. A bar extending in front of Sullivan's and Morris forms an outer harbor. Since the construction of jetties at these islands, the channel has been deepened to 22-26 feet. A lighthouse west of this channel has a light elevated 133 feet above the sea. On the island opposite the Battery is Castle Pinckney; Fort Ripley is farther out. Fort Moultrie, on Sullivan's Island, and Fort Johnston, on James Island, stand opposite each other, and Fort Sumter is on a small island at the entrance of the harbor, halfway between them. The city has about nine miles of water front, and most of the wharves lie on the Cooper River. The Clyde line of steamships ply between Charleston and New York, and there is steamboat connection also with Boston, Baltimore, Savannah, Georgetown, Beaufort and the Florida ports. Charleston is the terminus of the Plant system of railroads, and of the South Carolina and Georgia, and the Atlantic Coast line roads, and the city has ample street railroad accommodations.

COMMERCE.—Before the war Charleston was the chief cotton port in the United States, but it now ranks after New York and New Orleans. The present prosperity of the city is owing to the discovery of valuable beds of phosphates, the best of which are on the Ashley River. In 1895 the number of manufactories in Charleston was 405, with an aggregate capital of \$12,077,000, employing 6,858 persons, and the value of the products was \$16,882,000. The principal products were fertilizers, value \$4,265,000; rice, \$1,000,000; saw and lumber mill products, \$850,000; cotton goods, \$700,000; and flour and grist, \$700,000. The receipts included 420,169 bales of upland cotton; 276,778 tons of crude phosphate rock; 81,908,589 cubic feet of lumber and cross-ties; 74,492 barrels of rosin; 88,428 bales of domestic cotton goods; and 160,000 tons of fertilizers. The wholesale and retail trade aggregated \$29,159,000. In the calendar year 1896, the value of all imports was \$646,584, and of all exports, \$11,149,168. The chief articles of export are cotton, rice, fertilizers, phosphates, lumber, naval stores, and iron and steel. Large quantities of fruits and early vegetables are shipped to northern cities. In 1895 the assessed valuations were, real, \$16,630,364, personal, \$6,112,472—total \$22,742,836, with a tax rate of \$21 per \$1,000; and in 1896 the total bonded debt was \$3,839,700. The city has an elevation of eight or ten feet; the average temperature in summer is 79.55°; in winter, 57.46°. The drainage is tidal, and water is supplied by artesian wells. Pop. '90, 54,955.

CHARLESTON, town, capital of W. Va., and co. seat of Kanawha county; at the junction of the Kanawha and Elk rivers, 130 m. s. by w. of Wheeling. The Chesapeake and Ohio, the Ohio Central lines, and the Charleston, Clendenin, and Sutton railroads intersect. C. is an important shipping point; packets to Pittsburg, Cincinnati, and Gallipolis carrying the coal, iron ore and timber found in its neighborhood. The manufactures include iron, flour, sawed lumber, barrels, pumps, woollens, and cigars. The salt springs above the city are exceeded in productiveness by those of Syracuse, N. Y., only. The chief buildings are the state house and custom house. C. has an opera house, hotels, churches, banks, and several newspapers. A fort was built at C. about 1786; the town was incorporated in 1794; as a city, 1870. It has been the capital since 1869, with the exception of the period, 1875-85, when Wheeling was the seat of government. Pop. '90, 6742; since said to have more than doubled.

CHARLESTOWN, now a part of Boston, but formerly a city of Middlesex co., Mass. It is situated on the northern bank of the Charles river, and is connected with Boston by two free bridges. The Mystic river, which unites with the Charles at this

point, forms the boundary on the e. and north. The pop. in 1873, when the city was annexed to Boston, was 28,373. From the territory of Charlestown, originally very large, several towns have been taken on its northern side. The surface of the remaining portion is very uneven, two eminences, Bunker and Breed's Hills, rising near the centre, and affording many fine building sites. On Bunker Hill was fought a celebrated battle of the revolution, June 17, 1775, commemorated by a granite shaft erected on the summit and rising to the height of 220 feet. The corner-stone of this monument was laid in 1825 by Gen. Lafayette, and the work was finished in 1843. The attempt of the Massachusetts committee of safety to fortify this eminence was the immediate occasion of the battle, in the course of which the town was burned by the British, being set on fire by shells from Copp's Hill in Boston, and by men who were sent across the Charles for that purpose. C. is well built, having some fine streets and residences. It has an abundant supply of water from Mystic Lake, excellent schools, churches of various denominations, a public library, and a home for aged and indigent women. The state prison was formerly located here and the buildings used for that purpose are still standing. A navy-yard of the United States, covering more than 70 acres of ground, and having all the appointments required for such an establishment, has existed here since 1798. C. is also a place of considerable business. It has manufactories of steam engines, boilers and machinery, of stone and brass-ware, gas fixtures, mechanics' tools, leather, draw-pipes, sugar, soap, etc.

CHARLESTOWN, village and co. seat of Jefferson co., W. Va., on a branch of the Baltimore and Ohio railroad, 10 m. s.w. from Harper's Ferry; pop. '90, 2287. It is in a fine agricultural district. It was in this village that John Brown was tried, condemned, and hanged Dec. 2, 1859, and here a confederate force surprised union troops, Oct. 18, 1863, without gaining any advantage.

CHARLET, NICOLAS TOUSSAINT, a French painter and engraver, b. in Paris, 1792, was for some years employed as a clerk in a government office, but lost his place at the restoration, 1815, on account of his Bonapartism, and in consequence betook himself to art. After studying awhile under Gros, he gradually formed for himself a style in which he had no rival. C. is the Béranger of caricature, but without the political bitterness and sarcasm sometimes found in the poet. His genial sketches of French life and manners were studied with equal admiration in the salons of the aristocracy and in the ateliers, barracks, taverns, etc., of the lower classes. C. was especially successful in his sketches of soldiers and children. His designs are free from exaggeration, while full of spirit, interest, and naïveté; and his titles or mottoes were often so witty and suggestive, that dramatic writers have founded pieces upon them. His sketches and lithographs are very numerous, and are widely distributed. Among his paintings, the most remarkable are—"An Episode in the Russian Campaign" (in the museum at Versailles); "Moreau's Crossing of the Rhine" (at Lyons); and a "Procession of the Wounded" (at Bordeaux). C. died in 1845.

CHARLEVILLE, a t. of France, in the department of Ardennes, about a mile from Mezières, with which it communicates by a suspension bridge over the Meuse. It is a thriving place, well built, with clean spacious streets. It has manufactures of hardware, leather, and beer, and the Meuse affords facilities for considerable trade in coal, iron, slate, wine, and nails. Pop. '91, 17,390.

CHARLEVOIX, a co. in n.w. Michigan, on lake Michigan and Green river; 427 sq. m.; pop. '90, 9686. Grand Traverse bay bounds the county on the w., and Little Traverse bay on the north. The chief business is agriculture. Co. seat, Boyne.

CHARLEVOIX, a co. in the province of Quebec, Canada, forming a triangle, one side of which runs 80 or 90 m. along the n.w. bank of the St. Lawrence, reaching nearly to the Saguenay river; 5,224 sq. m.; pop. '91, 19,037, of whom all but 15 were Roman Catholics. The surface is mountainous, and not well adapted to agriculture. It is intersected by five or six rivers that fall into the St. Lawrence, and one that joins the Saguenay. Chief town, St. Paul's Bay.

CHARLEVOIX, PIERRE FRANÇOIS XAVIER DE, 1682-1761; a French Jesuit who was sent as a teacher to Quebec in 1705. After about five years he returned to France, and became professor of belles-lettres. He returned to Canada in 1720, and journeyed up the St. Lawrence and the lakes and down the Illinois and Mississippi to New Orleans, and thence went to Paris. His principal work is a valuable *History of New France* (or Canada), which was not published in English until 1865. He also wrote a history of Christianity in Japan, and a history of Paraguay.

CHARLOCK. See **MUSTARD**.

CHARLOIS, a village of the Netherlands, situated on the Maas, about 2 m. s.s.w. of Rotterdam. It is memorable on account of a terrible accident which occurred here in 1512, when a religious procession crossing the ice in defiance of magisterial prohibition, 8,000 of them were precipitated into the Maas. Pop. 2,000.

CHARLOTTE, a co. in s. Virginia, on Staunton river; intersected by the Norfolk and Western and the Southern railroads; 500 sq. m.; pop. 15,077, includ. colored. Surface hilly; productions, wheat, corn, oats, and tobacco. Co. seat, Smithville.

CHARLOTTE, a co. in s.w. New Brunswick, on the Maine border and the bay of Fundy; 1323 sq. m.; pop. '91, 23,752. The country is traversed by the New Brunswick and Canada, and the North American and European railroads. Shipbuilding and sea-fishing are the occupations of a great portion of the inhabitants. Chief town, St. Andrews at the mouth of St. Croix river.

CHARLOTTE, city and co. seat of Eaton co., Mich., 18 m. s.w. of Lansing, on the Michigan Central and the Chicago and Grand Trunk railroads; pop. '90, 3867. Lumber and agricultural products furnish the greater part of its trade. The city has gas, electric lights, water-works, public library, high school, national banks, and several weekly and monthly periodicals.

CHARLOTTE, city and co. seat of Mecklenburg co., N. C., on Sugar Creek, and the Southern and the Seaboard Air Line railroads; 45 miles s. w. of Salisbury. The city is in the gold region of the state, and a branch mint was established here in 1838 which was closed by the breaking out of the civil war, and reopened in 1869, and made an assay office. The city has many handsome residences, churches, and hotels, two opera houses, Biddle University (Presb.), public library, public park, a military institute, national banks, several newspapers, manufactures of cotton, iron, machinery, tobacco, cotton seed oil, fertilizers, agricultural implements, etc. The Mecklenburg Declaration of Independence (q. v.) was adopted here in May, 1775. In 1780 the British occupied Charlotte. Pop. '80, 7094; '90, 11,557.

CHARLOTTE AMALIE, chief, or rather only, town of St. Thomas, one of the Virgin group of the Antilles, in lat. 18° 20' n., long. 64° 55' west. It contains 11,400 inhabitants, nearly three-fourths of the entire population of the colony. It has a spacious harbor, which is largely visited by European ships in general.

CHARLOTTE AUGUSTA, 1796-1817; daughter of George IV. and Queen Caroline of England. She was well educated under the care of the bishop of Exeter and Lady Clifford. It was desired that she should wed the prince of Orange, but she loved and married prince Leopold of Saxe-Coburg, who, long after her death, became king of Belgium. She was married May 2, 1816; was delivered of a still-born child early in Nov. of the next year, and died, in consequence of malpractice, as was believed. Her officiating physician committed suicide. Her domestic life was most wretched, as her published letters show.

CHARLOTTE HARBOR, or BOCA GRANDE, an inlet in the gulf coast of Florida, 25 m. long, and 8 to 10 m. wide, with an entrance three-fourths of a mile wide, and 30 to 40 ft. deep. There is a good harbor, sheltered from the sea by a number of islands. Wild fowl, fish, and oysters are plentiful.

CHARLOTTENBURG, a t. of Prussia, in the province of Brandenburg, is situated on the Spree, 3 m. w. of Berlin, with which it is connected by a road leading through the *Thiergarten*, and affording a favorite promenade to the Berliners. C. contains a royal palace, with a fine garden and splendid orangery, and an interesting collection of antiquities and works of art. In a beautiful part of the park a mausoleum, designed by Schinkel, contains the remains of Frederick William III. and his wife, the queen Luise, with their statues by Rauch, and also of Kaiser Wilhelm I. Pop. '95, 132,383.

CHARLOTTESVILLE, a city and co. seat of Albemarle co., Va., 97 m. n.w. of Richmond, on the Southern and the Chesapeake and Ohio railroads. It is in an agricultural and fruit-growing region, has important manufactures, and is the seat of the university of Virginia, founded by Thomas Jefferson; and Monticello, Jefferson's home, is but 3 m. distant. Pop. '90, 5591.

CHARLOTTETOWN, capital of Prince Edward Island, in Queens co. and on the s. coast, is situated on Hillsborough bay, at the confluence of three rivers which admit the largest vessels. The town stands on rising ground and contains a provincial building, a government building, court-house, Y. M. C. A. building, an atheneum, exchange, a Dominion building (post-office, etc.), city-hall, two hospitals, an asylum for lunatics, a normal school, Prince of Wales college, St. Dunstan's (R. C.) college, a Methodist college, and a business college. A woolen factory, iron foundry, carriage and furniture factories, railroad workshops, breweries, and the exportation of grains (except wheat), pork, potatoes and fish, make it a busy place. There are steamers to various ports of the Dominion, churches, banks, gas and electric lights, excellent waterworks, splendid driving courses, and newspapers. Pop. '81, 11,485; '91, 11,374.

CHARLTON, a co. in s.e. Georgia, on the Florida border, including a portion of the great Okefenokee swamp; 1055 sq. m.; pop. '90, 3335, includ. colored. Productions, rice, cotton, tar, and turpentine. Surface level and soil sandy. Co. seat, Trader's Hill.

CHARM (Lat. *carmen*, a song), properly a form of words, generally in verse, supposed to possess some occult power of a hurtful, a healing, or a protective kind. Charms exert their influence either by being recited, or by being written and worn on the person; and, in this latter case, they may be classed with amulets (q. v.). The nature of this superstition will be more fully considered under INCANTATION; see also MAGIC.

CHARMANTE GABRIELLE, French romance, attributed to Henri IV., who sent the song with music to his mistress, Gabrielle d'Estrées, in a letter dated May 21 [1597], before he went on the campaign against the Spaniards. The words are thought to have been written by Bertaut, bishop of Seez, and the melody is supposed to be older. It is

found in the *Thesaurus harmonicus* of Besard (1602), and in the *Cabinet, ou Trésor des nouvelles Chansons* (1602), and, although Henri IV. has been credited with the music, the true composer is unknown.

CHARNEL-HOUSE (Fr. *charnier*; Lat. *caro*, flesh), a chamber situated in a churchyard or other burying-place, in which the bones of the dead which were thrown up by the grave-diggers were reverently deposited. The C. was generally vaulted in the roof, and was often a building complete in itself, having a chapel or chantry attached to it. In such cases, the charnel-vault was commonly a crypt under the chapel; and even in churches, it was not uncommon for the vault or crypt to be employed as a charnel-house.

CHARNOCK, STEPHEN, D.D., 1628-80; an English non-conformist minister, educated at Cambridge. He began to preach in London, and went thence to Dublin, where he was successful. In 1660, he was silenced by the act of uniformity, and returned to London; he continued 15 years in and near that city, preaching, but without a settled congregation. Many of his sermons have been published, and his work on the *Attributes of God* is still highly valued. He was a vigorous and original, as well as judicious thinker; and as a writer he was vivid and clear.

CHARON, in classical mythology, the son of Erebus and Nox, is first mentioned by the later writers of Greece. His duty was to ferry the shades of the buried dead across the rivers of the under-world. For this service, he exacted an *obolus* from each, and in consequence, a coin of this kind was placed in the mouth of the dead. If this rite was neglected, C. refused to convey the unhappy shade across, and it was doomed to wander restlessly along the shores of Acheron. C. is generally represented as a gloomy old man, with a rough beard and wretched clothes. In the Etruscan monuments, he holds a hammer.

CHARON'DAS, a lawgiver of ancient Greece, by some supposed to have been a disciple of Pythagoras. It is related that he fell a sacrifice to one of his own laws, by which it was made a capital offense to appear armed in a public assembly. On returning from a military expedition he hastened to quell a tumult, having his sword at his side. Being reminded by a citizen of his law, he replied, "Then I will seal it with my blood," and immediately plunged his sword into his breast.

CHAROST, ARMAND JOSEPH DE BETHUNE, Duc de, 1810-65; a descendant of Sully, the famous marshal. C. took part in the revolution of 1830 as a republican, and in 1833 was made a lieutenant. Afterwards he served in Algeria, and after the revolution of 1848 he was appointed under secretary of state. He was one of the zealous republicans in the national assembly, and one of the victims of Dec. 2, 1851, being imprisoned at Ham, and afterwards exiled to Belgium. In 1854, Napoleon III. expelled him from France, and he went to Holland and afterwards to Switzerland. He wrote a history of the campaign of 1815, in which he severely criticised Napoleon's generalship, and a history of the war in Germany in 1813.

CHARPIE. Surgeons lint, or the scrapings or ravellings of linen cloth, used in the dressing of wounds, ulcers, etc.

CHARQUI. See **JERKED BEEF**.

CHARR, *Salmo umbla*, a fish of the same genus with the salmon, occurring in the lakes of Britain and of the continent of Europe. It is abundant in the lakes of Cumberland and Westmoreland, and in some of those of Ireland, of the n. of Scotland, and of Orkney, but in the greater number of the Scottish lakes it is not found. It is the celebrated *ombre chevalier* of the lake of Geneva. It is sometimes found weighing more than 2 lbs., but is generally under 1 lb. in weight. It has only the anterior part of the *comer* (the middle line of the palate) furnished with the teeth, agreeing in this with the salmon and bull-trout, and differing from the common trout, salmon-trout, etc. The form is elongated, the greatest depth of the fish about one fifth of the entire length; the fins are rather small; the tail deeply forked; the color of the back dark olive, the sides lighter and spotted with either red or white, according to the condition in which the fish is at the time, the belly also being sometimes deep orange, and sometimes of a pale color; these, and other accidental variations, causing the fish to receive different names.

On some lakes, vast quantities are caught for the table, particularly for the purpose of potting. A C. is now and then taken with fly when the angler may be whipping a lake, which perhaps abounds with them, for trout; but this occurs but seldom. The C. will, too, occasionally take a minnow, if sunk deep and trailed slowly; but the sport it affords is of the most precarious nature. C. are fast diminishing in those of the English lakes which they still inhabit, owing to the wholesale and indiscriminate slaughter which occurs at the spawning season. A large kind of C., sometimes reaching 4 lbs. in weight, is found in some of the more northern Swedish lakes.

CHARRIÈRE, OR **CHARRIÈRES**, ISABELLE AGNÈTE DE SAINT-HYACINTHE DE, 1740-1805; a native of Holland, daughter of a Dutch baron, and married to a Swiss, who had been her brother's teacher. In 1786, appeared her most important book, *Caliste*, or *Letters Written in Lausanne*. She traveled in France and England, and was

an intimate friend of Benjamin Constant. She was a brilliant and beautiful woman, but, owing to loss of her estate, the latter years of her life were spent in strict seclusion.

CHARRON, PIERRE, 1541-1603; a French philosopher, one of the 25 children of a bookseller of Paris. He studied law at Bruges, and began practice in Paris, but not having immediate success, he went into the church, and rose to eminence as a preacher. At Berdeaux he formed a short but famous and important friendship with Montaigne, who, on his death in 1592, requested C. to bear the arms of the Montaigne family. In 1594, C. published *Le Trois Verités*, in which he seeks to prove that there is a God and a true religion, and that the true religion is the Roman Catholic. This was followed by a book of sermons, and in 1601 came his most remarkable work, *De la Sagesse*, a complete popular system of moral philosophy. This work brought upon its author the most violent attacks, but a second edition was soon called for. This, after much opposition, began to appear in 1603, but only a few sheets had been printed when C. died suddenly in the street.

CHART, a marine or hydrographical map, exhibiting a portion of a sea or other water, with the islands, coasts of contiguous land, soundings, currents, etc. See **MAP**. In the English service, when coasts have been surveyed by the admiralty, charts are engraved, and are sold at various prices, from 3s. down to 6d. each. This price is below their cost, the object being to encourage their general use as much as possible. Men-of-war are supplied with copies of every available C. published, relating to the regions likely to be visited. There is a printed list for every station. At Gibraltar and the Cape of Good Hope, there are depots of charts to supply ships whose destination undergoes a change. All the charts are brought home again, and none are reissued until revised and corrected. The navigating charts, showing the dangers of coasts, with sufficient clearness to enable mariners to avoid them, are generally on the scale of half an inch to a mile; those of larger size show all the intricacies of the coast. The merchant service in the United States is supplied with charts engraved and sold at less than their cost, by the coast-survey department of the United States navy. They are usually constructed on the principle of Mercator's projection. See **MAP**.

CHARTA, MAGNA. See **MAGNA CHARTA**.

CHARTÆ LIBERTATUM, charters of liberties; the Magna Charta (q.v.) and the Charta de Foresta, the latter made up of forest laws confirmed by Edward I.

CHARTÉ (Fr. a charter; Lat. *charta*, paper). In the sense in which we have adopted this word from the French, and in which it may be now said to form part of our language, it signifies a system of constitutional law, embodied in a single document. Whether any system of positive public law existed in ancient France is, in that country, a subject of keen dispute amongst constitutional antiquaries. If any such there was, there seems little doubt that it was the mere embodiment of traditions, and not the result of any single act of the national will. Whilst France was divided into provinces and communes, local liberties and privileges unquestionably existed; but where the nation constituted no single body, a constitutional charter was impossible. The first traces of such a C. appear in the 14th c.; and it is known in the history of the public law of France as the *grand charter*, or the charter of King John. Up to this time, the kings had called together only partial assemblies, but in 1355 deputies from the whole kingdom were assembled in the hall of the parliament of Paris. The nobility and clergy, secular and regular, were represented by 400 deputies, the commons or third estate by a like number. This body assumed to itself the initiative, and prepared a species of constitution, which was accepted by the king. The chief triumph of the third estate on this occasion consisted in carrying through the doctrine, that the decision of any two estates should be invalid without the concurrence of the third. The three orders, who seem to have composed but one assembly, then proceeded to impose a series of restrictions on the power of the monarch, which, confirmed by the dauphin two years later, formed the foundation for the liberties subsequently asserted at the revolution.

But the constitution to which the term C. is most frequently applied by the French and by us, is that in which Louis XVIII. solemnly acknowledged the rights of the nation on his restoration in 1814. This C. has ever since been considered the fundamental law of constitutional monarchy when that form of government has existed in France. In some of its provisions, however, and still more in the mode of its acceptance by the monarch, as "a voluntary and free act of our royal authority," and as a "concession made to," not a contract entered into with, his subjects, it was open to the misconstructions which eventually led to the revolution of 1830. The "charte" sworn to on the 29th Aug. of that year by King Louis Philippe modified this and some of the other provisions of that of 1814. On that occasion, the king explicitly recognized the sovereignty of the people. This document, which, with some modifications, remained in force till the revolution of 1848, is of so much importance, not only from its bearing on the past history, and possibly on the future destiny of France, but from the analogies which it presents to our own constitution, that we shall endeavor to present a condensed view of its leading provisions.

It consisted of 67 articles, divided into 7 heads. Of these, the 1st head, containing 11 articles, treated of the public rights of the French people. It provided for the equality of all Frenchmen—a doctrine inherited from the revolution, and which it unfortunately left to be understood in a sense inconsistent with monarchy, and indeed with any other form of government than pure democracy (see *LIBERTY*; *EQUALITY*, *ETC.*)—for their equal admissibility to all employments, civil and military, and for their freedom from arrest, otherwise than by legal process. It guaranteed the enjoyment of religious liberty, and the payment of the ministers of all Christian denominations—a privilege which in 1831 was extended even to Jews. The liberty of printing and publishing was insured, the censorship of the press and conscription were abolished, an amnesty for all political offenses was proclaimed, and the security of property guaranteed, except when its sacrifice should be requisite for the public good, in which case it was declared that the owner must be indemnified. The 2d head set forth the nature and limitations of the kingly power in 8 articles. The supreme executive power, the command of the army and navy, and the right of making war, and treaties of peace, alliance, and commerce, were reserved to the monarch. To him, also, it belonged to nominate to all offices of public administration, to make all necessary regulations for the execution of the laws, but in no case to suspend them or dispense with them. The high duties of legislation were shared between the king, the chamber of peers, and the chamber of deputies; it being provided that every law should be agreed to by a majority of each chamber, and sanctioned by the king. Any one of the three branches of the legislature might originate any bill, except a money-bill, which was reserved for the chamber of deputies, as for the house of commons in England. The 3d head contained ten articles regarding the chamber of peers, the nomination of whom was vested in the king (the princes of the blood being peers by right of birth). No limit was set to their number; but by the law of 9th Dec., 1831, incorporated in the C., it was declared that their dignity should be for life only. The chancellor of France was president. The chamber of peers assembled simultaneously with that of the deputies, and its sittings were public. The personal privileges of the peerage, as they exist in England, were introduced. The 4th head concerning the chamber of deputies contains 16 articles. It provides for the election of the deputies and the sittings of the chamber. The electoral qualification is declared to be the payment of 200 francs of direct taxes, whilst that of a deputy is the payment of 500. The voting is by ballot, both at elections and in the chambers. The number of deputies, which at first was 430, was afterwards raised to 459. Each deputy was elected for 5 years, and one half of those for each department were required to have their political domicile within it. The C. became a nullity by the revolution of Feb., 1848; and by the new constitution promulgated on the 4th of Nov. of that year, the monarchy of France was converted into a democracy. By chapter 4 of that document, the legislative power was vested in a single assembly of 950 members, including the representatives of Algeria and the other colonies. The property electoral qualification was abolished, and the age reduced for electors to 21, and for delegates to 25. The period of three years was fixed for the continuance of the national assembly. By chapter 5, the executive power was intrusted to a citizen, who was to bear the title of president. He was not to be less than 30 years of age, his tenure of office was to be 4 years, and he was not to be re-eligible until after an interval of 4 years. For an account of the subsequent changes by which these and the other arrangements adopted at the revolution of 1848 have since been superseded, see *FRANCE*.

CHARTER (Lat. *charta*; Gr. *chartes*, paper, or anything written upon, from *charasso*, to scratch or write). In its most general signification, C. is nearly synonymous with *deed* and *instrument*, and is applied to almost any formal writing, in evidence of a grant, contract, or other transaction between man and man. In private law, its most important use is in the alienation of real estates, the writing given to the new proprietor by the old, in proof of the transference title, being usually called a charter. In public law, the name is given to those formal deeds by which sovereigns guarantee the rights and privileges of their subjects, or by which a sovereign state guarantees those of a colony or other dependency. See *CHARTER*, *MAGNA CHARTA*. There is another sense of the term, in which it is in a measure intermediate between the two we have mentioned—viz., where we speak of the C. of a bank or other company or association. In this latter sense it signifies an instrument by which powers and privileges are conferred by the state on a select body of persons for a special object. See *BANK*, *CORPORATION*, *JOINT-STOCK COMPANY*, *ETC.* The requisites of a C., when used in the first of these significations, according to the law of England, will be pointed out under *DEED*.

ROYAL CHARTERS, generally written in Latin, are of two kinds: I. Grants of lands, houses, honors, or liberties to persons who did not previously possess them; II. Charters confirming grants previously made, and therefore called "charters of confirmation." Confirmation charters are of three kinds: 1. Charters confirming previous grants, without reciting them; 2. Charters of simple confirmation, without addition of anything new; 3. Charters reciting previous charters and confirming them, with addition of something new. These last two classes of charters are called charters of "*inspeximus*," or "*vidimus*," from the word used by the granter in saying that he has seen the C. which he confirms. Royal charters generally contain seven clauses: 1. The "premises,"

i.e., the name and style of the granter, the persons to whom the C. is addressed, the name and style of the grantee, the reason why the grant is made, and the description of the thing granted; 2. The "tenendum and habendum," i.e., the way in which the thing granted was to be held and had; 3. The "reddendo," the return of rent or service which was to be made to the granter by the grantee; 4. The "quare volumus," or order that the grantee should have the thing granted, under certain penalties; 5. The "sealing" or "signature" clause, setting forth the seal, signature, or subscription by which the C. was authenticated; 6. The "hiis testibus," or testing-clause, enumerating the persons who were present as witnesses when the C. was granted; 7. The "date," setting forth the time when, and the place where, the C. was granted.

CHARTER, in American colonial history, means the grant of franchise, governmental privileges, and estates to companies for the purpose of establishing colonies, to the inhabitants of colonies in general, or to individual proprietors. Of the first sort, were the charter of Massachusetts Bay granted by Charles I. (1629), and the charter of Georgia granted by George II. (1732). Of the second sort was the charter of Connecticut granted to the people of the colony by Charles II. (1660). Of the third sort were the original charter of New York, granted to the duke of York by Charles II. (1664), and the charter of Maryland, granted to Lord Baltimore by Charles I. (1632).

Charters are either *blench* or *feu*, from the nature of the service stipulated—a *me* or *de me*, from the kind of holding or relation between the granter and grantee; and original or by progress, from being first, or renewed, grants of the subjects in question.

Blench and Feu Charters.—The duty which the superior required of his vassal in former times was almost always military service, and the vassal was then technically said "to hold ward"—to hold on condition of warding or defending his superior. But subsequent to the rebellion of 1745, in which the dangerous tendencies of the feudal relation were experienced, this holding was abolished (20 Geo. III. c. 50), and the only duties which it has since been lawful to insert in C. are *blench* and *feu* duties. The former is a merely nominal payment—a penny Scots, a red rose, or the like, *si petatur tantum* (should it be asked); the latter is a consideration of some real value. Original *blench* C. having lost all object, and having no other effect but that of subjecting superiors to considerable expense in keeping up their titles, have become rare in modern practice. The forms of charters varying according to the circumstances in which they are granted, and the relations established between the granter and grantee, are of too technical a nature to admit of explanation in this work. They will be found very clearly and shortly stated in Bell's *Law Dictionary*, voce "Charter."

CHARTER-HOUSE (a corruption of *Chartreuse*, i.e., Carthusian), the name of a hospital, chapel, and school-house in London. The C. was instituted in 1611 by sir Thomas Sutton, Camps castle, in the co. of Cambridge. In 1872 the school was transferred to Godalming, Surrey. It had originally been a Carthusian monastery (founded in 1371), but on the dissolution of monastic establishments by Henry VIII., it was made a place of deposit for his nets and pavilions. After undergoing many alterations, and passing into the possession of various distinguished persons, it was finally purchased from lord Suffolk, for £13,000, by sir Thomas Sutton, who endowed it with the revenues of upwards of 20 manors, lordships, and other estates, in various parts of England. This "masterpiece of Protestant English charity," as old Fuller calls it, serves three uses—it is an asylum for poor brethren, an educational and a religious institution; hence Bacon terms it a "triple good." The *poor brethren* are 80 in number. None are admitted under 50 years of age, and only those who have been housekeepers are eligible. Each brother has a separate apartment, a share of attendance from domestics, an ample, though plain diet, and an allowance of about £26 a year for clothes and other matters, and four weeks' holiday every autumn. The brethren must be bachelors and members of the church of England. Among the poor brethren in by-gone years were Elkanah Settle, the antagonist of Dryden; John Bagford, the antiquary; Isaac de Groot, a descendant of Grotius; and Alexander Macbean, who assisted Johnson in the preparation of his dictionary. The *scholars* are 60 in number, admissible between the ages of 11 and 15. They are understood to be "the sons of poor gentlemen to whom the charge of education is too onerous;" as in the case of the *poor brethren*, it is not always the proper parties who are chosen. There are exhibitions, scholarships, and medals competed for at certain times by the scholars. In addition to the scholars properly so called, i.e., such as receive a free board and education, a large number of youths are sent to the charter-house school because of its reputation. These either board with the masters, or simply attend during the day. The number of extra boarders is nearly double that of the scholars. The institution is under the direction of the queen, 15 governors, selected from great officers of the state, and the master himself, whose salary from the foundation is £800 per annum. Among the eminent individuals educated in this establishment, are Dr. Barrow, Judge Blackstone, Addison, Steele, John Wesley, Bishop Thirlwall, George Grote, W. M. Thackeray, and sir Charles Eastlake.

The buildings were close together in C.-house square. When the C. school removed to Godalming, the school premises were sold to the merchant Taylor's school, which is now installed here in handsome new school buildings, erected 1875. The quaint old hospital and chapel, the latter containing Sutton's tomb, still remain.

CHARTER OAK, a large and famous tree that stood in Hartford, Conn., until blown down, Aug., 1856, when its age was computed to be nearly 1000 years. Sir Edmund Andros assumed his unwarranted government of the Connecticut colony, at Hartford, on the night of Oct. 31, 1687, and, according to a generally accepted tradition, the colonial charter was brought into the council-chamber. By previous agreement, the lights were suddenly blown out, and Captain Joseph Wadsworth, seizing the document so necessary to the liberties of the people, escaped and hid it in a hollow of the tree, where it remained till 1689.

CHARTER-PARTY (Fr. *chartre-partie*, so called from such documents being at one time divided—in Fr. *parti*—and one half given to each party concerned), the title given to a contract in which the owner, or master of a ship, with consent of the owner, lets the vessel, or a portion of her, to a second party, for the conveyance of goods from one port to another port; hence the vessel is said to be *chartered*. The document must be stamped. It must specify the voyage to be performed, and the terms on which the cargo is to be carried. On the part of the ship, it is covenanted that she shall be seaworthy; well-found in rigging, furniture, and provisions; and that the crew be suitable in number and competency; that she shall be ready to receive the cargo on a given day, wait its complete delivery for a certain period; and sail for the stipulated port when laden, if the weather for the time permits. The freighter's portion of the contract obliges him to load and unload at suitable periods, under specified penalties, and to pay the freight as agreed on. The master must not take on board any contraband goods, or otherwise render the vessel liable to seizure. The owner is not responsible for losses caused by war, fire, or shipwreck, unless arising from negligence of the master or crew.

CHARTIER, ALAIN, the most distinguished man of letters in France in the 15th c., supposed to have been born about 1392. After studying at the university of Paris, he is supposed to have entered the service of Charles VI., and after that to have followed the fortunes of Charles the Dauphin, afterwards Charles VII. Of stories connected with him, the one of the kiss bestowed by Margaret of Scotland, wife of that Louis the Dauphin who was afterwards to be known as Louis XI., "on that precious mouth from which has issued so many witticisms and virtuous sentences," is interesting if only as a proof of the high degree of estimation in which the ugliest man of his day was held. His best works are said to be *Le Lièvre des Quatre Dames*, which was called forth by the battle of Agincourt, and *Le Quadrilogue-Invectif*, a patriotic dialogue. He d. about 1430.

CHARTISM, a movement in Great Britain for the extension of political power to the great body of the people, arising in a great measure out of wide-spread national distress and popular disappointment at the results of the reform bill. Prior to 1831, the middle classes had sought popular aid towards obtaining their own enfranchisement. The assistance was given, the people expecting to receive help in their turn. After the passing of the reform bill, agitation ceased for a time, and the members returned to parliament were indifferent, or opposed, to any further change in the political arrangements of the country. The middle classes were satisfied with their own success, and generally looked with small favor on projects for the further extension of political influence among the masses. A season of commercial depression set in about 1835, and failing harvests for several years terribly increased the sufferings of the people. Food became dear, wages fell, manufactories were closed, work became scarce. The people associated their sufferings with their want of direct influence upon the government, and agitation for an extended franchise began. In 1838, a committee of 6 members of parliament and 6 working-men prepared a bill, embodying their views as to what were just demands on the part of the people. This was the "people's charter." It claimed—1. The extension of the right of voting to every (male) native of the United Kingdom, and every naturalized foreigner resident in the kingdom for more than two years, who should be 21 years of age, of sound mind, and unconvicted of crime; 2. Equal electoral districts; 3. Vote by ballot; 4. Annual parliaments; 5. No property qualification for members; and 6. Payment of members of parliament for their services. This programme was received with enthusiasm. Immense meetings were held all over the country, many of them being attended by two or three hundred thousand people. Fiery orators fanned the popular excitement, and under the guidance of the extreme party among their leaders, physical force was soon spoken of as the only means of obtaining justice. The more moderate and thoughtful of the chartists were overruled by the fanatical and turbulent spirits, and the people, already aroused by suffering, were easily wrought into frenzy by those who assumed the direction of their movements. In the autumn of 1838, torch-light meetings began to be held. The danger of these meetings was obvious, and they were at once proclaimed illegal. Some of the more prominent leaders were arrested, amid intense popular excitement, and subjected to various terms of imprisonment. A body calling itself the national convention, elected by the chartists throughout the kingdom, commenced sitting in Birmingham in May, 1839. It proposed to the people various means of coercing the legislature into submission, recommending, among other things, a run on the savings-banks for gold, abstinence from excisable articles, exclusive dealing, and in the last resort, universal cessation from labor. During its sittings, a collision took place with the military in Birmingham. Public meetings were forbidden, and alarming excesses were committed by the irritated mob. In June, 1839, a petition in favor of the charter was presented to the House of Commons, signed by 1,280,000 per-

sions. The House refused to name a day for its consideration and the national convention retaliated by advising the people to cease from work throughout the country. Fortunately, this advice was not followed, but the disturbance in the public mind increased, and in Nov., an outbreak at Newport took place, which resulted in the death of 10 persons and the wounding of great numbers. For taking part in this wild insurrection, three of its leaders were sentenced to death, but their punishment was afterwards commuted to transportation. In 1842, great riots took place in the northern and midland districts, not directly caused by the chartists, but encouraged and aided by them after the disturbances began. In the same year, an attempt was made by Joseph Sturge to unite all friends of popular enfranchisement in a complete suffrage union, but he only succeeded in dividing their ranks. In 1848, the turmoil in France created great excitement in England, and much anxiety was felt lest an armed attempt should be made to subvert the institutions of the country. Two hundred thousand special constables were enrolled in London alone. There were several local outbreaks, and much real danger, but the attempts at disorder were efficiently met, and, as usual, the only result was the punishment of the more prominent men, and the postponement of the desired reforms.

Since 1848, C. has gradually died out. Its principles were not new. The duke of Richmond, in 1780, introduced a bill into the House of Lords to give universal suffrage and annual parliaments. In the same year, Charles James Fox declared himself in favor of the identical six points which were afterwards included in the charter. And nearer our own time, earl Grey, Mr. Erskine, sir James Mackintosh, and many others, formed a "society of friends of the people," which aimed at obtaining a very large extension of the suffrage.

The great body of chartists were, however, not so much actuated by the weight of precedent or argument, as impelled by the pressure of actual want, and an indefinite feeling that the laws were somehow to blame for not providing them with the means of comfortable subsistence. But there were many among them who had studied the principles involved in their demands, and maintained them from an intelligent conviction of their truth. These men declared that all persons had an equal natural right to share in determining the laws under which they lived; and further, that as they were required to contribute to the taxation of the country, they were justly entitled to be heard as to the application of the public funds. Taxation and obedience being universal, representation ought to be so. This view being conceded, all the other points of the charter naturally followed, they being merely arrangements for securing the free action of the right contended for. Some of the chartist advocates went far beyond this. There were those among them whose aims included little less than the reorganization of society. One of the ablest advocates of the cause wrote in favor of nationalizing the land, and remodeling the currency; he also proposed a system of state loans for the assistance of laborers who desired to become capitalists, and national marts for the exchange of wealth on terms of equity and justice. Pressed a little further, these views would have developed into communism; but so far as we are aware, most chartists held so strongly the doctrine of *individual* rights, that they were not likely to subordinate *man* to *society*. See COMMUNISM, SOCIALISM. The object aimed at by the majority was merely the extension of the franchise to the masses, in the belief that they would use it wisely and honestly, and put an end to what they considered the selfish and interested rule of classes who had long monopolized the control of the state. The opponents of C. answered, that if the question was argued as one of right, it would go far beyond the conclusions which the chartists had reached. The *right* appertained to women as well as to men, and there was no just reason why sane persons under 21 should be deprived of it. It would also, they maintained, give all power to the most ignorant classes of the community, and thus subject intelligence to brute force. Government existed for the benefit of society, and ought, as far as possible, to depend on the wisdom, and not on the mere number of the people. Then if representation depended upon taxation, it should vary in proportion to the taxes paid. Finally, they denied that men *as such* had a right to vote; their right was to be well governed, and universal suffrage was more likely to destroy society than to confer happiness or insure justice.

The cause which put an end to C. as an organization was undoubtedly the improvement in the circumstances of the people which followed the repeal of the corn laws. Since then, the chief points of the charter have actually become law. A property qualification is no longer necessary in a representative; the reform acts of 1867-68 have virtually established manhood suffrage; and the act of 1872 gave vote by ballot. The efforts of the majority of those who live by manual labor are now directed towards securing, by trades-unions and other means, a larger share than formerly in the profits of industry.

CHARTRES, a city of France, in the department of Eure-et-Loir, 47 m. s.w. of Paris, is built partly at the base and partly on the declivity of a hill overlooking the river Eure, which is here divided into two channels, one flowing within, and the other without the ramparts, which are converted into agreeable promenades. C. consists of an upper and lower town, connected by streets almost inaccessible to carriages. The upper town has some good streets, but the lower is ill built. The houses are old, and many of them composed of wood, with their gables to the street. The cathedral, one of the largest and most imposing ecclesiastical structures in Europe, with its lofty spires, one of them towering to a height of more than 400 ft., crowns the top of the hill. It has numerous painted-glass windows, the workmanship of which is unsurpassed, if indeed equaled,

elsewhere in France, and many of them date from the thirteenth century. It is also famous for its sculptured scenes from the life of Christ and of the Virgin. The church of St. Pierre, and the obelisk to the memory of gen. Marceau, are also objects of interest. It is a great market for the cattle and grain of the surrounding region. It has manufactures of woolen, hosiery, and leather. Pop. '91, 23,108.

CHARTRES, ROBERT PHILIPPE LOUIS EUGÈNE FERDINAND D'ORLÉANS, Duc de, b. 1840; the youngest son of the late duke of Orleans, and grandson of Louis Philippe. His father died when he was but two years old, and when he was eight the revolution drove him into exile. He was cared for at Eisenach, in Germany, but soon afterwards joined his family, who were in England. In 1860, he traveled in the east, and in 1861 came to the United States with his elder brother, the count of Paris. Both of them served for a time in the war between the states on Gen. McClellan's staff; but went to England in the summer of 1862. In June, 1863, Robert married his cousin Françoise Marie Amélie d'Orléans, by whom he has five children. After the revolution of Sept., 1870, he returned *incognito* to France, and served in Gen. Chanzy's army; and in 1871, after the repeal of the act banishing the Orléans family, he was appointed a maj. in the army and served in Algeria. He was suspended from the active list in 1883, and expelled from the army by the law of 1886.

CHARTREUSE, LA GRANDE, a celebrated monastery in France, in the department of Isère, situated 13 m. n.e. of Grenoble, in the wild and romantic valley of the Guiers, nearly 4,000 ft. above the sea. It is surrounded by the mountain-forests of the Alps; and the route to it, through a mountain-gorge, down which a rapid river dashes far below the traveler, while above him rise precipitous and foliage-lined rocks, some hundreds of feet in height, is one of the most picturesque. The convent is a huge ungainly structure, dating mostly from the 17th c., earlier buildings having been destroyed several times by fire. The convent owes its origin to St. Bruno, who settled a little higher up the mountain in 1084, giving the name of the place, C., to his order. The monks had at one time considerable property, but they were despoiled at the revolution of 1789.

CHARTREUSE, a famous kind of liqueur (q.v.), so called from the fact that it is made at the celebrated Carthusian monastery near Grenoble. Three qualities are made, green, yellow, and white, the green being the richest and most delicate in flavor. Chartreuse is said to be a most complex product, resulting from the maceration and distillation of balm leaves and tops as a principal ingredient, with orange peel, dried hyssop tops, peppermint, wormwood, angelica seed and root, cinnamon, mace, cloves, Tonquin beans, *Calamus aromaticus*, and cardamoms.

CHARTULARY (Lat. *chartularia*, *chartologia*) is, as its name implies, a collection of charters. So soon as any body, ecclesiastical or secular, came to be possessed of a considerable number of charters, obvious considerations of convenience and safety would suggest the advantage of having them classified and copied into a book or roll. Such book or roll has generally received the name of a chartulary. Mabillon traces chartularies in France as far back as the 10th c., and some antiquaries think that chartularies were compiled even still earlier. But it was not until the 12th and 13th centuries that chartularies became common. They were kept not only by all kinds of religious and civil corporations, but even by private families. Many of them have been printed.

CHARYBDIS. See SCYLLA AND CHARYBDIS.

CHASE. When one vessel is pursuing another at sea, the pursued vessel is often called the *chase*, and the pursuer the *chaser*. The manœuvre also gives name to certain guns on board ship: a *bow-chaser* being a gun pointing ahead, and a *stern-chaser* pointing astern.

CHASE, a co. in e. central Kansas, on the Neosho river and its affluents, intersected by the Atchison, Topeka and Santa Fe railroad; 750 sq.m.; pop. '90, 8233. It is an agricultural region. Co. seat, Cottonwood Falls.

CHASE, a co. in s.w. Nebraska, formed 1873; surface level, with little timber; area, 888 sq.m.; pop. '90, 4807. Co. seat, Imperial.

CHASE, IRAH, D.D., 1793-1864; educated at Middlebury college and Andover theological seminary, and ordained in 1817. He labored for a time as a Baptist missionary in West Virginia, and in 1818 became professor in a theological school in Philadelphia. The school was transferred to Washington, and he remained in his professorship seven years. In 1825, he aided in establishing a theological school at Newton Center, Mass., in which he was a professor for nearly 20 years. In 1830, he assisted in founding the Baptist mission in France. Among his works are *The Life of John Bunyan*; *The Design of Baptism*; *The Work Claiming to be the Constitution of the Holy Apostles, revised from the Greek*; *Infant Baptism an Invention of Man*; and many sermons and essays.

CHASE, PHILANDER, D.D., 1775-1852; graduated at Dartmouth in 1795, and ordained to the ministry of the Episcopal church in 1798. He labored as a missionary in western New York, and in 1811 became rector of Christ Church in Hartford, Conn. In 1817 he went to Ohio, where, two years afterward, he was chosen bishop. A few years later he laid the foundation of Kenyon college and Gambier theological seminary. In 1835, he became bishop of Illinois, where he was instrumental in founding Jubilee college, at Robin's Nest, where he died. Among his works are, *A Plea for the West*; *The Star in the West*, or *Kenyon College*; *Reminiscences*, etc.

CHASE, SALMON PORTLAND, 1808-73; b. N. H. He was the son of a farmer, and a nephew of Bishop Chase, who supervised his earlier education. Graduating from Dartmouth college in 1826, he opened a school for boys at the national capital, and in 1830 was admitted to the bar, where almost his earliest work was the preparation of an edition of the statutes of Ohio with annotations, and a sketch of the history of the state. This assisted him in gaining practice, and in 1834 he was appointed solicitor in Cincinnati for the bank of the United States. His first effort in a cause touching slavery was in defense of a colored woman claimed as a fugitive. He maintained that the fugitive slave law of 1793 was void, because unwarranted by the federal constitution. In the same year he defended James G. Birney (subsequently the candidate of the abolitionists for president), who had been prosecuted under the state law for harboring a slave. In this case he argued that slavery was a local institution, and that as the slave had been brought into a free state by his master, he was in fact free. In 1846, in the Van Zandt case before the U. S. supreme court, he took the ground that under the ordinance of 1787 no fugitive from service could be reclaimed from Ohio unless he had escaped from one of the original states; that it was the understanding of the makers of the constitution that slavery was to be left to the disposal of the several states, without sanction or support from the federal government; and that the clause in the constitution relating to persons held to service was a compact between the states, conferring no power of legislation on congress, and was never intended to confer such power. In 1841, he was prominent in the organization of the liberty party of Ohio, which nominated him for governor. In the national liberty convention at Buffalo in 1843, and in subsequent conventions until the nomination (in 1848) of Martin Van Buren for president, C. was a leading member, and in most cases directed the proceedings. In Feb., 1849, he was chosen U. S. senator from Ohio, his vote coming from all the democrats and a few freesoil members. He acted generally with the democrats until the nomination (in 1852) of Pierce on a strongly pro-slavery platform, when he withdrew and undertook the formation of an independent democratic party. The debate on the Nebraska bill gave him an opportunity to oppose the famous compromise, to which he moved an amendment looking to the exclusion of slavery from all the territories; but it was not adopted. Through all the contest for the repeal of the Missouri compromise and the Kansas debate, he was foremost in opposition to slavery extension. In the mean time, he was heard on other important subjects. He favored internal improvements by the general government, and supported the free homestead movement, and cheap postage. In 1855, he was elected governor of Ohio by the votes of the opponents of the Nebraska bill, and he was re-elected in 1857. His name was before the first national convention of the republican party (1856) for president, but was withdrawn at his own request. He was named, also, in the convention that nominated Lincoln, but was not pressed. In 1861, he was appointed secretary of the treasury, and held the office until July 30, 1864, when he resigned. In this position the arduous duties of sustaining the national credit in the struggle with the civil war devolved in a great degree upon him; and he proved equal to the occasion. The death of Roger B. Taney in Oct., 1864, made a vacancy in the chair of the chief justice of the U. S. supreme court, which was immediately filled by the appointment of C., in which capacity he presided at the trial on the impeachment of Andrew Johnson in Mar., 1868. About this time, his dissatisfaction with the course of the republican party became so decided as to throw his influence on the side of the democrats, at whose national convention, July, 1868, he was prominently, though unsuccessfully, urged as a presidential candidate. In 1870, he was stricken with paralysis, the effects of which lasted until his death.

CHASE, SAMUEL, 1741-1811; one of the signers of the declaration of American independence; son of an Episcopal clergyman, and a lawyer in Annapolis, Md. He was one of the earliest and strongest friends of colonial liberty; was a member of the continental congress for four years, and in 1776 went with Charles Carroll and others on the fruitless errand to induce the Canadians to join in the rebellion against English rule. He filled several judicial offices in Maryland, and in 1796 was appointed associate justice of the U. S. supreme court. In 1804, John Randolph brought about his impeachment for misdemeanor in the conduct of political trials, but he was found not guilty on trial by the U. S. senate. He remained on the supreme court bench until his death.

CHASE, WILLIAM MERRITT, American artist, was born in Franklin, Ind., in 1849; began his studies in 1868 under B. F. Hays, a portrait painter in Indianapolis; in 1869 removed to New York and studied at the National Academy of Design; spent the years 1872-78 abroad, at Munich chiefly as pupil of Wagner and Piloty, returning to make New York his residence. He was president of the Society of American Artists in 1894-95; sold his collection of paintings and bric-a-brac in 1896; and took a class of young men and women artists to Spain for several months' study in 1897. Among his works, which are remarkable for vigor of execution and for rendering of textures, are *The Dowager* (1875); *The Court Jester*, which received a medal at the Centennial Exhibition; *Ready for a Ride* (1878); *Portrait of General Webb* (1880); *The Coquette* (1884); *Summer Afternoon in Holland* (1887); *An Revoir* (1889).

CHASIDIM ("Pietists"). This name anciently denoted a whole class of Jewish sects. After the Babylonish captivity, the Jews, with regard to their observance of the law of

Moses, were divided into two classes—*Chasidim* and *Zadikim*. When the so-called great synagogue was commissioned by the Persian government to draw up a code of civil and religious laws for the emigrant Jews returning to settle in their native land, several innovations were made on the Mosaic law. Those who accepted these innovations were styled the C.; while those who rejected them were styled, or styled themselves, the *Zadikim*, or “upright,” because they adhered strictly to the law given by Moses, without observing any of the additions made to it. The C. branched forth into several sects, all holding traditions in connection with the written law, which they believed to possess a divine sanction equally with that law. The Pharisees, so often mentioned in the New Testament, formed an early sect among the C., while from the *Zadikim* sprang forth the Hellenistic Samaritans, Essenes, Sadducees, etc. Afterwards, the C., or Pharisees, split into Talmudists, Rabbinites, and Cabalists, some of whom underwent still further subdivision.—The modern C. are not, like those in the times of the Maccabees, marked by any peculiar spiritualistic tendency in religion, but rather by a strict observance of certain traditional forms, and a blind subservience to their teachers. Their doctrine was promulgated in the middle of the 18th c. by Israel of Podolia, called *Baal-Shem* (“lord of the name,” so called because he professed to perform miracles by using the great cabalistic name of the supreme being). Though condemned by the orthodox rabbis, this new teacher had great success in Galicia, and when he died (1760) left 40,000 converts. They are now broken into several petty sects; their religion is utterly formal, and its ceremonies are coarse and noisy.

CHASING, the art of working raised or half-raised figures in gold, silver, bronze, or other metal. It was called *calatura* by the Romans; and the term is expressly limited by Quintilian to working in metal. The same art when exercised on wood, ivory, marble, precious stones, or glass, was called *sculptura*. See CARVING. Iron was sometimes, though rarely used, silver having been always the favorite metal for this purpose. Closely connected with, but still distinguished from C., is the art of stamping with the punch, which the Romans designated by *excudere*. The Greek *toreutike* is usually supposed to correspond to C., but the point is by no means free from dispute. The art was known at a very early period, as may be inferred from the shield of Achilles, the ark of Cypselus, and other productions of the kind. Such portions of the colossal statues made by Phidias and Polycletus, as were not of ivory, were produced by the toreutic art. The statue of Minerva was richly adorned in this manner. Besides Phidias and Polycletus, Myron, Mys, and Mentor were celebrated toreutic artists in antiquity, and amongst many moderns the most famous is Benvenuto Cellini (q.v.).

CHASLES, MICHEL, b. 1793; a French mathematician, educated at the Paris Polytechnic School. In 1841 he was appointed professor of geometry in that institution. Among numerous essays and books of his productions are: *Historical Views of the Origin and Development of Methods in Geometry*; *History of Arithmetical*; and *Treatise on Superior Geometry*. In 1851, he became a member of the academy, and in 1867, he reported to that body that he was in possession of 27,000 letters and documents of great antiquity and value, among them letters and papers believed to have been written by Dante, Petrarch, Rabelais, Julius Cæsar, Shakespeare, and other persons of renown. Only about 100 of these were genuine, though they completely imposed upon C. and other good judges. The forger, Irene Lucas, was imprisoned two years for forgery and fraud. C. d. 1880.

CHASLES, VICTOR EUPHÉMION PHILARÈTE, 1798–1873; a French writer who traveled in the United States about 1820–23. In 1837, he was director of the Mazarin library, and in 1841, professor of German language and literature in the college of France. He published in 20 vols. *Comparative Studies of Literature*; wrote tales and books of travel; and prepared editions of classic authors.

CHASSE, music composed in imitation of the chase, and performed chiefly by horns, occasionally combined with other wind instruments. Its movement is in $\frac{3}{4}$ time. The best specimens of this kind of music are an overture by Mehul, and a C. for the piano-forte by Kreutzer.

CHASSE-CAFÉ. See POUSSE-CAFÉ.

CHASSÉ, DAVID HENDRIK, Baron, was b. in Tiel, Mar. 18, 1765, began his military career when but ten years of age, became a lieut. in 1781, and capt. in 1787. After the revolution of that year, C., as siding with the humbled Dutch patriots, took French service; was appointed lieut.col. in 1793; and, two years later, found himself marching towards the Netherlands under the command of Pichegru. He afterwards fought with the French in Germany and Spain, gaining great distinction and the appellation of *Général Bayonnette*. As lieut.gen. of the Dutch forces in 1815, C. added to his laurels on the field of Waterloo. After the peace he was made governor of Antwerp in 1830, and bravely defended it against the united Belgians and French from Nov. 29 till Dec. 23, 1832, when he was forced to surrender. He died in May, 1849.

CHASSELOUP-LAUBAT, JUSTIN NAPOLÉON SAMUEL PROSPER DE, Marquis, 1805–73; in 1837, a member of the French chamber of deputies and afterwards councillor of state. In 1849, he was again a member, and then and afterwards a supporter of Louis Napoleon, who made him minister of marine. He was for some years the president of the colonial board of Algeria. In 1869, he presided over the council of state until the accession of Ollivier's administration.

CHASSEPOT, a breech-loading rifle invented by Antoine Alphonse Chassepot, b. Mar. 4, 1833. He was attached, in 1858, to the Government workshops of St. Thomas at Paris, of which he was made director in 1864; and was afterwards officially attached to the national manufactory of arms at Chatellerault, near Poitiers. He took out patents for his invention, and the royalty has brought him a large income. He was decorated with the cross of the legion of honor in 1866. The first model of the C. was exhibited in 1863; but it was not introduced in the French army till after the Prussians had proved the efficiency of the needle-gun in the war of 1866 against Austria; it was used successfully in the Franco-German war of 1870. The C. is an improved needle-gun; the fulminate is in a paper wad which forms the rear of the cartridge envelope; the gas check is a cylindrical ring of vulcanized India rubber, which is pressed against the surface of the chamber when the explosion takes place; the cartridge envelope is of silk or linen, with a caliber of .433 inch. The gun has 4 grooves, and can be fired 12 times a minute at a range of 1200 yards. An improved form of the C. has been recently introduced in France, in which the metallic cartridge can be used. See illus., GUNS, vol. VII., fig. 14, and the article BREECH-LOADING ARMS.

CHASSEURS (Fr., hunters) is a name used for two important forces in the French army. The mounted C. (*chasseurs-à-cheval*) are a body of light cavalry, designed for service in advance or on the flanks of the army, and correspond most nearly to the light horse of the British service. The name is first used in this sense in 1741, and has been retained while the force it denotes has undergone many alterations in organization and equipment. In 1831, a body of cavalry was raised for service in Africa, mounted on Arab horses, and with a distinct uniform. These have since become famous as the *C. d'Afrique*. After the reorganization of the French army in 1873, the effective army contained 14 regiments (subsequently increased to 20) of *chasseur-à-cheval*, besides 4 regiments of *C. d'Afrique*.—The infantry C. (*chasseurs-à-pied*) are a light infantry force in many respects corresponding with the cavalry C., and like them intended for detached service (like the rifle corps in the English army). The French are believed to have adopted the idea of such a force of sharpshooters from the *Jäger* (the German word corresponding to C. or *hunters*) in the German armies. First used in the thirty years' war, the *Jäger* derived their name from the fact that they were chiefly drafted from amongst mountaineers and inhabitants of forest regions. They have always been regarded as a valuable contingent in the Prussian and Austrian armies, or even constitute the entire force of light infantry. In France, the equipment of the C. differed little from that of the other infantry; it was not until the formation, in 1838, of the *C. de Vincennes*, that the experiment of a specially armed force of sharpshooters was fairly tried. The fame of the C. de Vincennes for rapidity and precision of movement, as well as for the accuracy of their fire, soon vindicated the importance of this branch of the infantry; and at present there are 30 battalions of *chasseurs-à-pied* in the French army.

CHASTELARD, PIERRE BOSCOBEL DE, 1540–63; a French poet, a scion of the house of Bayard. The name of Chastelard is romantically connected with that of Mary queen of Scots. He was a page in the house of Marshal Danville, whom he accompanied in his journey to Scotland as escort of Mary in 1561. C. returned to Paris in the marshal's train, but left almost immediately for Scotland bearing letters of recommendation to Mary from Montmorency, and also the "regrets" addressed to the queen by Pierre Ronsard. C.'s master in the art of song. The enthusiastic page fell in love with the queen, who is said to have encouraged his passion. Copies of verses passed between them, and she lost no occasion of showing herself partial to his person and conversation. The young man hid under her bed, where he was found by the maids of honor; but Mary pardoned the offense, and the old familiarity between them was resumed. Again C. was so rash as to violate her privacy; but he was discovered, seized, sentenced, and hanged the next morning. He met his fate consistently, reading, on his way to the scaffold, Ronsard's "Hymn to Death," and turning at the moment of doom towards Holyrood, addressing to his unseen mistress the famous farewell: "Adieu! thou so fair and so cruel; thou killest me, and yet I cannot cease to love thee!" Another story is that he simply ejaculated "Cruel queen!" emphasizing the words by a threatening gesture. See Swinburne, *Chastelard, A Tragedy* (1865).

CHASTELER, JEAN GABRIEL JOSEPH ALBERT, Marquis de, 1763–1825. He was in the Austrian service as a general officer, and served in the war of the Bavarian succession, and in the war against the Turks. He defended Namur against the French, participated in the third partition of Poland, and was sent to Russia to engage the emperor Paul in a coalition against France. In 1799, he was in the Russo-Austrian army, and was seriously wounded before Tolona, Italy. He fought in the Tyrol against Napoleon, but was beaten by Lefebvre, May 13, 1809, and was compelled to fly to Hungary. When the Lombardo-Venetian kingdom was established, he was made governor of Venice.

CHASTELLUX, FRANÇOIS JEAN, Marquis de, 1734–88; a French soldier and author, distinguished in the seven years' war in Germany, and in the army of Rochambeau in

the American revolution, where he held the rank of maj.gen. His chief works are *De la Félicité Publique; Voyages in North America*; and a *Discourse on the Advantages Resulting to Europe from the Discovery of America*.

CHASTE-TREE. See VITEX.

CHASUBLE (Lat. *casula*, *casubula*, and *cassibula*), the uppermost garment worn by priests in the Roman Catholic church, when robed for the celebration of the mass. It was called also "the vestment," and under that name seems occasionally to have been used in the English Church after the reformation. Originally it covered the priest from head to foot, like a little house, whence some writers think it had its name of *casula*. In more recent times, at least, it was made of velvet. It was of an elliptical shape, like a *vestica piscis*, with a hole in the middle for the head; it had no sleeves. When put on, it showed two peaks, one hanging down before; another, on which a cross was embroidered, hanging down behind. According to Hildebert, the C. signified good works; according to Aleuin, charity; according to another writer, the unity of the faith. Durand makes one peak the symbol of love to God, the other peak the symbol of love to our neighbor. In France, the press or wardrobe in which chasubles were kept was called the *chasublier*.

CHAT, *Savi'cola*, a genus of small birds of the very numerous family *sylviadæ* (q.v.), distinguished by a bill slightly depressed, and widened at the base. They have rather longer legs than most of the family. They are lively birds, flitting about with incessant and rapid motion in pursuit of the insects on which they chiefly feed. They are found in Europe, Asia, Africa, and New Holland. Three species are British—the stonechat, whinchat, and wheatear.—The yellow-breasted C. of the United States (*icteria polyglotta*) is a larger bird, and belongs to the family *turdidæ* or *merulidæ*.

CHATARD, FRANCIS SILAS, D.D., b. Baltimore, 1834; educated Mt. St. Mary's coll., Emmitsburg, Md., at the univ. of Maryland, and at the Urban coll., Rome. He was private chamberlain to Pope Pius IX.; rector of the American coll. at Rome; and was consecrated Rom. Cath. bishop of Indianapolis, Ind., 1878. He is the author of *Christian Truths*, and of various essays, discourses, and translations.

CHÂTEAU, CHATEL, or CASTEL, from the Lat. *castellum*, a fort, enters as a component part into many names of places in France.

CHATEAUBRIAND, FRANÇOIS AUGUSTE, Vicomte de, one of the most distinguished of French authors, was b. Sept. 14, 1768, at St. Malo, in Bretagne, and received his early education in the college at Rennes. While traveling in North America in 1790, he accidentally read in an English newspaper the account of the flight and arrest of Louis XVI. He immediately returned to France, intending to fight against the republic; but being seriously wounded at the siege of Thionville, in Sept., 1792, he escaped to England, where he lived in such poverty that he was compelled to make translations for the book-sellers, and to give lessons in French. In 1797, he published his first political essay, *Sur les Révolutions Anciennes et Modernes, considérées dans leurs Rapports avec la Révolution Française* (2 vols., London), a republican and sceptical work, the outcome of hardship, poverty, and sorrow. His skepticism soon vanished, but republican impulses continued to flash out at intervals during the whole of his strangely-checkered, inexplicable, and inconsistent career. In 1800, C. returned to Paris, and wrote for the *Mercur de France*. In this journal, he first printed his tale of *Atala* (1801), with a preface lauding the first consul, Bonaparte. Its success was remarkable, but nothing to the miraculous enthusiasm excited by his *Génie du Christianisme* (1802), a work exactly suited to the jaded skepticism of the age, and also in accordance with the policy of the first consul, who was then concluding the concordat with the pope, and wished to make the Roman Catholic priesthood subservient to his measures. Bonaparte, therefore, appointed C. secretary to the embassy in Rome, and, in 1803, sent him as ambassador to the little republic of Valais. On the execution of the duke d'Enghien, Mar. 21, 1804, C. resigned in disgust. In 1806, he commenced his pilgrimage to the Holy Land, visited Greece, Palestine, Alexandria, and Carthage, and returned through Spain to France in May, 1807. From this period to the fall of Napoleon, he lived privately, publishing only two works of any value—*Les Martyrs* and the *Itinéraire de Paris à Jérusalem*. In 1814, his eloquent brochure, *De Bonaparte et des Bourbons*, excited such attention, that Louis XVIII. declared it was worth an army of 100,000 men in favor of legitimacy.

After the battle of Waterloo, C. returned to Paris, where he was made peer and minister of state. Gradually his monarchical zeal subsided, and, in his address, *De la Monarchie selon la Charte*, delivered in the chamber of peers, he gave expression to such liberal tendencies as offended the king, who erased his name from the list of his counselors. Soon, however, he appeared again as an ultraroyalist; and at the baptism of the infant duke de Bordeaux, C. presented to the duchess of Berry a flask filled with water from the Jordan. In 1822, he was appointed ambassador-extraordinary to the British court, but was rather rudely dismissed from office in 1824.

In 1826, C. prepared the first edition of his collected works, for the copyright of which the publisher gave the large sum of 600,000 francs, of which C. returned 100,000. During the days of July, 1830, he was staying with his friend Mme. Récamier at

Dieppe; but as soon as he heard tidings of the revolution, he hastened to Paris. He refused to take the oath of fealty to Louis Philippe. This political crotchitness, which always rendered it impossible to know beforehand what course of conduct C. would adopt, is perhaps best explained by the following passage from his *De la Restauration et de la Monarchie Elective* (Paris, 1831): "I am a Bourbonist in honor, a monarchist on grounds of rational conviction; but in natural character and disposition, I am still a republican." In 1832, he revised a new edition of his works, and, after visiting the court of the expelled Bourbons, devoted his attention to the preparation of his memoirs, intended to be published posthumously (*Mémoires d'outre Tombe*), though considerable extracts were printed during his lifetime. He also found leisure to write several other works. He died July 4, 1848. See Sainte-Beuve, *Chateaubriand et son Groupe Littéraire* (1877).

C. wrote with warmth, energy, and a rich supply of imagery. Many of his descriptive passages are excellent, but his ideas want depth and coherency.—Marin, *Histoire de la Vie et des Ouvrages de M. de Chateaubriand* (2 vols., Paris, 1832).

CHÂTEAUDUN, a t. of France, in the department of Eure-et-Loir, is situated on the Loir, a tributary of the Loire, about 26 m. s.s.w. of Chartres. The streets are straight and well built, and an old castle, with an enormous tower, overlooks the town. C. has manufactures of blankets and leather. Pop. of commune, '91, 7147.

CHÂTEAUGAY, a s.w. co. in the province of Quebec, Canada, on the St. Lawrence, drained by the Châteaugay, the Noire, and other rivers; 250 sq. m.; pop. '91, 13,864. It is generally level, and the soil is fertile. Chief town, Ste. Martine.

CHÂTEAUGUAY, SIEUR DE. See **LE MOYNE**.

CHÂTEAUNEUF DE RANDON, a village of France, in the department of Lozère, 12 m. n.e. of Mende. A pretty historical incident connected with the place, which was formerly fortified, makes it interesting. In 1380, the fortress, then held by the English, was besieged by the troops of Charles V., under the command of the gallant Du Guesclin. The English governor, sore pressed, promised to yield in fifteen days if no succor arrived. In the meantime, Du Guesclin died, and his successor was appointed, who, at the expiry of the fifteen days, summoned the governor to surrender. He refused to yield up the keys to any but Du Guesclin; and when informed of his death, marched out, and on bended knee laid the keys and his sword on the dead hero's bier.

CHÂTEAUROUX, a t. of France in the department of Indre, situated on a rising ground in the midst of an extensive plain, on the left bank of the river Indre, 166 m. s. of Paris by railway. The town, which was formerly dirty and ill built, has been greatly improved within the last quarter of a century. C. does not possess much interest for the traveler. It is a busy place, with extensive woolen factories, besides manufactures of cotton, hosiery, yarn, hats, paper, parchment, hardware, leather. Pop. '91, 23,924.

CHÂTEAUX-EN-ESPAGNE (Fr. castles in Spain), romance castles; castles in the air; day-dreams.

CHÂTEAU-THIERRY, a t. in the department of Aisne, France, on the river Marne; pop. of commune, '91, 6863. It has a commercial college, a public library, and manufactures of linen, cotton, leather, and earthenware. There is a marble statue of La Fontaine, the fabulist. The town takes its name from a castle said to have been built by Charles Martel for Thierry IV., the ruins of which are on an adjacent hill. The position of Château-Thierry has subjected it to many disasters. It was captured by the English in 1421, by Charles V. in 1545, by the Spanish in 1591; pillaged in the Froides wars in 1652, and suffered severely in the Napoleonic campaign of 1814.

CHÂTEL, FERDINAND TOUSSAINT FRANÇOIS, Abbé, 1795-1857; ordained as a priest in 1818, serving as vicar to several French towns, and as chaplain in the army. In 1831, he founded a new sect in whose doctrines Christ was to be venerated only as a perfectly good man, and the confessional, fasting, and vows of chastity and celibacy were to be omitted. The authorities interfered in 1842 and closed his place of worship, but in 1848 he appeared again as an especial champion of women's rights. His public meetings were suppressed in 1850, and he passed his later years in the duties of a metropolitan postmaster.

CHÂTELAINE (Fr. *chateau*, a castle). Literally the mistress of the castle, who carried her keys suspended from her belt by a chain of gold. In later times other articles were added, a watch, seal, vinaigrette, etc., attached by chains to an ornament at a lady's waist, hence called a châtelaine.

CHÂTELET, the name of two old fortresses of Paris, believed by some to have been built in the time of Julius Cæsar. The grand C. was restored by Louis IX. and remodeled by other kings. It was demolished in 1802.

CHATELET-LOMONT, GABRIELLE EMILIE, Marquise du, a very learned French woman, notorious for her intimacy with Voltaire, was born at Paris, 17th Dec., 1706. At an early period she displayed a great aptitude for the acquisition of knowledge. She studied Latin and Italian with her father, the baron de Breteuil, and subsequently betook herself with zeal to mathematics and the physical sciences. Distinguished alike for her beauty and talent, she soon found a host of suitors for her hand. Her choice fell on the marquis du Châtelet-Lomont, but her marriage did not hinder her from forming a *tendresse*

for Voltaire, who came to reside with her at Cirey, a château on the borders of Champagne and Lorraine, belonging to her husband. Here they studied, loved, quarreled, and loved again, for several years. In 1747, however, poor Madame C. became "not insensible to the brilliant qualities" of a certain M. Saint-Lambert, a capt. of the Lorraine guards; and the result was, that the philosopher had to make room for the soldier, and content himself for the future with being the "devoted and indulgent friend" of his former mistress. This new intimacy became fatal to Madame Châtelet. She died at Luneville, 10th Sept., 1749, a few days after having given birth to a child. Her first writing was a treatise on the philosophy of Leibnitz. She also translated the *Principia* of Newton into French, accompanying it with algebraic elucidations. It did not, however, appear till 1756, some years after her death. Her correspondence with Voltaire is interesting; but the fact that a woman so highly gifted as Madame C., and possessing so many amiable qualities, should never have dreamed that there was anything wrong in her *liaisons*, proves with terrible conclusiveness how corrupt was that philosophic society which, in the 18th c., professed to explode superstition and enlighten France and the world.

CHÂTELHERAULT, a t. of France, in the department of Vienne, situated on the river of that name, 18 m. n.e. of Poitiers. A handsome stone bridge, with a massive castellated gateway, built by Sully, at one end, connects it with a suburb on the other side of the river. C., which is an ill-built, mean-looking town, is one of the chief seats of the manufacture of cutlery in France, and since 1820 has had a national manufactory of swords and bayonets. Its river-port makes it the entrepôt for the produce of an extensive district. The duke of Hamilton derives his title of duke of Châtelherault from this place. Pop. of commune, '91, 22,522.

CHATHAM, a co. in s.e. Georgia, on the ocean and the South Carolina border; 433 sq. m.; pop. '90, 57,740, includ. colored. Co. seat, Savannah.

CHATHAM, a co. in central North Carolina, drained by the Rocky, New Hope, Deep, and Haw rivers; 784 sq. m.; pop. '90, 25,413. Co. seat, Pittsboro.

CHATHAM, the name of a township and of a village in Morris co., N. J. The village is on the Passaic river, and the Delaware, Lackawanna and western railroad, 23 miles from New York city, and 12 miles w. of Newark. It contains a public library, churches, clubs, waterworks, manufactories of tar paper and manilla paper, etc., and is the seat of an extensive rose culture. The roads in the vicinity are good and the scenery is picturesque. Many who do business in the large cities near by, have residences here. Pop. of the village about 1500; of the township, '91, 4681.

CHATHAM, a town in Barnstable co., Mass.; on the southeastern extremity of Cape Cod, and the New York, New Haven, and Hartford railroad; 18 miles e. of Barnstable; 80 miles s.e. of Boston; lat. 41° 40' 15" n.; long. 69° 56' 31" w. The town was founded in 1665, and incorporated in 1712, and contains the villages of North Chatham, Chathamport, South Chatham, and West Chatham, public library, churches, good public schools, including a high school. Two lighthouses are situated near the town, and fishing and navigation are the principal occupations of the inhabitants. Chatham has of late years become a fashionable summer resort. Population '90, 1954.

CHATHAM (Saxon, *Ceteham* or *Cætham*, understood to signify the "village of cottages"), a parliamentary borough, river-port, fortified town, and naval arsenal, in the co. of Kent, situated on the right bank of the Medway, at the upper part of its estuary, 30 m. e.s.e. of London. Much of C. is ill built and irregular. The High street is 1½ m. long, parallel to the river, and swarms with soldiers and Jews. The refuse timber of the dockyard is much used in building the house-walls. C. owes its importance to its naval and military establishments situated at Brompton village (on a height half a mile n. of C.); and on the Medway estuary. The C. fortified lines are the frequent scenes of field-operations, imitation battles, and grand reviews. Pop. '91, 31,711. The borough, which sends one member to parliament, is governed by a head-constable under the magistrates of Rochester. The Romans seem to have once had a cemetery here. Traces of Roman villas have been found, with Roman bricks, tiles, coins, and weapons. The dockyard was founded by Elizabeth before the threatened invasion of the Spanish Armada. In 1662 it was removed to its present site. In 1667 the Dutch, under De Ruyter, sailed up the estuary of the Medway, and, in spite of the fire from the castle, destroyed much shipping and stores. In a military point of view, the lines of detached forts connected with C. constitute a fortification of great strength; and the whole is regarded as a flank defense for London in the event of an invader seeking to march on the capital from the s. coast. The place is also defended by some strong forts on the Medway. In and near C. are a military hospital and strong fort; barracks for infantry, marines, artillery, and engineers; a park of artillery; a school for engineers; and magazines, store-houses, and depots on a large scale. In a naval sense, C. is one of the principal royal shipbuilding establishments in the kingdom, and a visit to it never fails to impress the stranger with a sense of the naval power of England. The dock-yard contains several building-slips and tide docks sufficiently capacious for the largest ships. One peculiar establishment in this dock-yard is a metal mill, which supplies all the royal dock-yards with copper sheets, copper bolts, and other articles in copper and mixed metal. The saw-mills at C. are very extensive. The actual workmen, artisans, and

laborers vary in number according to the amount of shipbuilding and repairing going on.

CHATHAM, a town in Northumberland co., N. B., on the Miramichi river, near its entrance into Miramichi bay; pop. '91, 5,000. It has a Roman Catholic cathedral, a college, and a temperance hall. It is a port of entry, and a summer resort, and has a large export trade in fish, lumber, etc.

CHATHAM, a town in Kent co., Ontario province, Canada, on the Thomas river, 47 m. e. of Detroit, Mich.; reached by the Great Western railroad, and by steamboats from the lakes. It is in a rich agricultural district, and has a large trade in grain and lumber. Pop. '91, 9052.

CHATHAM, a magisterial dist., Pittsylvania co., Va., including Chatham vill., traversed by Virginia Midland railroad. Pop. '90, 7394.

CHATHAM, WILLIAM PITT, Earl of, sometimes styled **PITT THE ELDER**, one of the greatest English orators and statesmen of the 18th c., was the son of a country gentleman, Robert Pitt of Boconnoc, in Cornwall; and was b. Nov. 15, 1708. After an education at Eton and Oxford, he traveled on the continent, and on his return obtained a cornetcy in the blues. In 1735, he entered parliament for Old Sarum—that synonym for electoral corruption—a borough then belonging to his family. He espoused the side of Frederick, prince of Wales, then at deadly feud with the king, and offered a determined opposition to Walpole, who was at the head of affairs. He was deprived of his commission in consequence—an insult and injury which only increased the vehemence of his denunciations of the court and the government. His influence, both in and out of the house of commons, increased rapidly; and Walpole, being driven from power, the king, notwithstanding his hatred of Pitt, found it necessary to allow of his admission to a subordinate place in the broad bottom administration; subsequently he was appointed to the lucrative office of paymaster-general. The duchess of Marlborough, pleased with his patriotism and powers of oratory, left him £10,000; and later, sir William Pynsent, struck with similar admiration, left him his whole property. In 1755, when Henry Fox (afterwards Lord Holland) was made secretary of state, finding himself opposed to the foreign policy of the new minister, Pitt resigned office as paymaster. In the following year, when the king, unwillingly acceding to popular demands, had to dismiss Fox, Pitt became nominally secretary of state, but was virtually premier. He immediately began to put into execution his own plan of carrying on the war with France. He raised the militia, and strengthened the naval power; but the king's old enmity, and German predilections, led him to oppose Pitt's policy, who thereupon resigned office in April, 1757, but was recalled in June, in obedience to the loud demands of the people.

Now firmly established in power, Pitt's war policy was characterized by unusual vigor and sagacity. Success returned to the British arms. French armies were beaten everywhere by Britain and her allies—in India, in Africa, in Canada, on the Rhine—and British fleets drove the few French ships they did not capture or destroy from almost every sea. But the prime mover of all these brilliant victories found himself compelled to resign (1761), when, on the accession of George III., and owing to the influence of lord Bute, it was attempted to introduce a vacillating policy into the government; his immediate cause of resignation being the refusal of the majority of the cabinet to declare war with Spain, which Pitt, foreseeing as imminent, wished to commence before the Spaniards were thoroughly prepared. As some recompense for his important services, Pitt received a pension of £3,000 a year; and his wife, sister of George Grenville, was created Baroness Chatham. Until 1766, Pitt remained out of office, not offering a factious opposition to government, but employing all his eloquence to defeat some of its most obnoxious measures. In that year he received the royal commands to form a ministry. He undertook the task, choosing for himself—to the astonishment of the public, and the sacrifice, to a considerable extent, of his popularity—the almost sinecure office of privy seal, with a seat in the house of lords as viscount Pitt and earl of Chatham. Ill-health prevented C. from taking any active part in this ministry, of which he was nominally the head, and which was weak and embarrassed throughout, and he resigned in 1768, to hold office no more. He did not, however, cease to take an interest in public affairs. He spoke strongly against the arbitrary and harsh policy of government towards the American colonies, and warmly urged an amicable settlement of the differences. But when, America having entered into treaty with France, it was proposed by the duke of Richmond to remove the ministers, and make peace on any terms, C., though much debilitated, came down to the house of lords, and in a powerful address protested against the implied prostration of Britain before the throne of the Bourbons, and declared war, with whatever issue, preferable to the proposed terms of peace. This address secured a majority against the motion, and the war was continued. But it was the orator's last effort; for, exhausted by speaking, on rising again to reply to a query addressed to him by the duke of Richmond, his physical powers suddenly failed, he fell back into the arms of his friends, and was carried from the house. He died May 11, 1778. He was honored with a public funeral in Westminster Abbey, where a statue was also erected to his memory at the public expense; and, in addition, government voted

£20,000 to pay his debts, and conferred a pension of £4,000 a year on his descendants. C.'s personal appearance was dignified and imposing, and added greatly to the attractions of his oratory, which was of the most powerful kind. His upright and irreproachable character demanded the admiration of his enemies; but his affectedness and laugh-tiness not unfrequently disgusted his friends, and pride rather than principle seems to have actuated his course at some important conjunctures of his life. He had, however, an intense love of country; the grand object of his ambition being to make his native land safe against all contingencies, and powerful among nations.

CHATHAM ISLANDS, a small group in the Pacific, lying about 400 m. due e. of the Canterbury settlement, on the Middle island of New Zealand, in lat. 43° 38' to 44° 40' s., long. 177° to 179° w., being thus almost precisely the antipodes of Toulouse, in France. They were discovered in 1791 by lieut. Broughton, both the cluster and its chief member taking the name of his ship. Chatham island is computed to contain 600,000 acres; a salt or brackish lake, however, of 20 m. in length, occupying the interior. The soil and climate of the archipelago, in general, are said to be good. Wheat yields abundantly; and the horses, cattle, and pigs which have been introduced thrive well. Timber of any size is unknown, so that the native canoe, instead of being cut out of a single tree, is merely wicker-work bound together by cordage of indigenous flax. The aborigines have two missions among them—one from Germany, and the other from New Zealand.

CHATI, a cat, *felis mitis*, smaller than the ocelot, and something like the leopard, a native of South America. It greatly annoys farmers by destroying fowls, birds, and smaller animals. Like all of the cat kind, it hunts mostly in the dark.

CHÂTILLON, a t. of France in the department of Côte-d'Or, on the Seine, about 45 m. n.n.w. of Dijon. Pop. '91, 5127. C. is chiefly famous on account of the congress of allied sovereigns held here in 1814, from Feb. 5 to Mar. 19, for the purpose of negotiation with Napoleon respecting conditions of peace. Several of the conditions proposed by the allies Napoleon could not bring himself to submit to, and the negotiations broke up, Mar. 19. On the 25th, when their armies were, in fact, marching on Paris, the allies from Vitry issued their declaration justifying a continuation of the war.

CHAT MOSS, a bog in Lancashire, the largest in England, about 7,000 acres in extent, and celebrated as having been the scene of the first great and successful efforts for the reclaiming of bogs, by Mr. Roscoe of Liverpool, in the end of the 18th and beginning of the 19th c., and of one of the great engineering triumphs of George Stephenson in the construction of the Liverpool and Manchester railway. It is situated between Liverpool and Manchester, at no great elevation above the sea. It is from 20 to 30 ft. in depth, and of such consistence that when an attempt was first made to survey it for the Liverpool and Manchester railway, the attempt was relinquished because of the impossibility of obtaining a sufficiently solid stand for the theodolite. Drains are filled up almost as fast as they are cut, by a pulpy stuff flowing into them, and affect only a few feet on either side. Great danger is experienced by any person stepping unwarily on the surface of the bog; and when he begins to sink, his struggles to extricate himself only cause him to sink faster and deeper. Mr. Roscoe's agricultural improvements were effected by numerous parallel drains in the parts on which he operated. The use of *pattens* by his workmen, and the adaptation of them to the feet of the horses employed, have been mentioned in the article Bog. The enlargement of the circle upon which a horse's foot rests from 5 in. diameter to 7, nearly doubles it, and consequently diminishes nearly by one half the pressure on each unit of surface. Mr. Stephenson, when he could find no one to countenance him in his views, calculated with confidence on the application of this principle to the railway, so that even the ponderous locomotive and train might be supported by a sufficient extension of the bearing surface; and this he accomplished by spreading branches of trees and hedge-cuttings, and in the softest places rude hurdles interwoven with heather, on the natural surface of the ground, containing intertwined roots of heather and long grass; a thin layer of gravel being spread above all, on which the sleepers, chairs, and rails were laid in the usual manner. Drains were at the same time cut on both sides of the line, and in the central part of the moss a conduit was formed beneath the line of railway, of old tar-barrels placed end to end. Notwithstanding difficulties which every one but himself deemed insuperable, Mr. Stephenson constructed the portion of the line through C. M. at a smaller expense than any other part of the railway. There still is "a sort of springiness in the road over the moss, such as is felt when passing along a suspension-bridge;" and "those who looked along the moss as a train passed over it, said they could observe a waviness, such as precedes and follows a skater upon ice."

The complete reclaiming of C. M. for agricultural purposes can be only a question of time and expense. It seems capable of becoming one of the most productive tracts of land in England.

CHATOYANT, a term to denote the changeable internal light seen in some minerals, such as "cat's eye." See CAT'S EYE.

CHÂTRE, La, a t. in the department of Indre, France, on the river Indre, 20 m. s.e. of Chateauroux; pop. 5000. There is a ruined castle, one of the towers of which is still used as a prison.

CHATSWORTH, the magnificent mansion of the duke of Devonshire, and one of the most splendid private seats in England, is situated in Derbyshire on the Derwent, 12 m. n. by w. of Matlock. William the Conqueror gave the domain to his natural son William Peveril. It was purchased by sir W. Cavendish in Queen Elizabeth's time. Sir W., in 1570, began the old mansion, which was finished by his widow, afterwards countess of Shrewsbury. In this building Mary Queen of Scots was imprisoned for 13 years. The present edifice, called a palace from its grandeur, includes the old Ionic pile, 183 by 172 ft. built 1687-1706, by the first duke of Devonshire, after designs by Talman and Wren. The façade is 720 ft. long, or with the terraces, 1200 feet. The grounds around are 9 m. in circuit, and are only surpassed by those at Versailles.

CHATTAHOOCHEE, a river of the United States, rises on the eastern declivity of the Blue Ridge of the Alleghanies, in the n. of Georgia; traverses that state in a s.w. direction; becomes the boundary between it and Alabama; and finally, after receiving the Flint from the left, crosses Florida, under the name of Appalachicola, into the gulf of Mexico. With an entire course of 550 m., it is navigable upwards as far as Columbus, 350 m. from the sea. It forms the principal outlet for the cotton crops of its basin.

CHATTAHOOCHEE, a co. in s.w. Georgia, on the Alabama border; 220 sq. m.; pop. '90, 4902, includ. colored. Agriculture is the chief business. Co. seat, Cusseta.

CHATTANOOGA, city and co. seat of Hamilton co., Tenn.; on the Tennessee River, 151 miles s.e. of Nashville. The city is finely situated on high hills among picturesque scenery. It was settled in 1836, and was originally called Ross's Landing. It was incorporated in 1851, and in 1863 was occupied by the union forces, and was almost destroyed during the war. It contains a handsome marble custom house, the Baroness Erlanger hospital, a public library, banks, a fine opera house, several large hotels, excellent public schools, Grant University (Methodist), the Chattanooga Female Institute, and the Chattanooga Medical College. The Chickamauga and Chattanooga National Military Park, laid out by the federal government on the site of the battle of Chickamauga, is east of the city, and was dedicated Sept. 19-20, 1895. Near it is the National Soldiers' Cemetery, one of the largest in the country, containing 13,000 graves. South of city is Lookout Mountain, from which there is a magnificent view extending to seven states. The Tennessee River is navigable most of the year from Chattanooga to the Mississippi, and nine lines of railroad pass through the city, making it the most important railroad centre in the South. The region is rich in coal, iron, marble, kaolin, and timber, and the city has developed very rapidly. In 1890 there were 294 manufactories, with an aggregate capital of \$7,405,646, employing 5741 hands, and the value of the products was \$10,216,109. Pop. '80, 12,872; '90, 29,100.

CHATTANOOGA, BATTLE OF. After the retreat of Rosecrans from the field of Chickamauga, Sept., 1863, the confederates under Bragg sent a cavalry force across the Tennessee above Chattanooga, and seized several points on the railroad in order to cut off his supplies. Shortly afterwards, Grant relieved Rosecrans and assumed command of the department of the Tennessee, Cumberland, and Ohio. Thomas was appointed commander of the department of the Cumberland, Sherman was assigned to the department of the Tennessee, and Hooker, with the 11th and 12th corps, which had been transferred from the army of the Potomac, was sent across the river to make a flank movement against Bragg, while a force under William F. Smith was thrown across the river at Brown's ferry, below Chattanooga, to seize the points of Lookout mountain that commanded the passage of the river. These measures, which were executed Oct. 27, 28, and 29, were successful in restoring the connection between the union army at Chattanooga and its depot of supplies. Sherman's army having arrived, the movement against the confederates was begun Nov. 23. Thomas's troops attacked and carried the enemy's first line of rifle-pits at 2 p.m., and held it during the night. The next day the attack was renewed along the whole line. Thomas strengthened himself in his advanced position, repelling every effort of the enemy to recover the lost ground. Sherman succeeded in carrying Missionary ridge, and Hooker, after partially carrying Lookout mountain, entrenched himself in a strong position, compelling the abandonment of the mountain by the enemy during the night. On the 25th the battle raged from dawn till dark. Missionary ridge, Lookout mountain-top, and all the rifle-pits in the valley, were carried by desperate fighting. The confederate army was routed, and pursued by Sherman and Hooker back to Georgia. The union loss was between 6,000 and 7,000 in killed, wounded, and missing. The confederate loss in killed and wounded is estimated at 2,500; in prisoners, 6,000. The effect of this battle was to cut off Bragg from communication with Longstreet, forcing the latter to abandon the siege of Knoxville and retreat into Virginia.

See the memoirs of Grant and Sherman, and the account, given in greater detail, in *Battles and Leaders of the Civil War* (1889-90).

CHATEL (Fr. *chatel*, old Fr. *chapitel*, from Lat. *capitale*, corrupted into *capitale* and *catalum*, meaning the capital or principal sum in a loan; hence goods in general, especially cattle, as distinguished from land), in the law of England, is a term used to designate any kind of property which, with reference either to the nature of the subject or the character of the interest possessed in it, is *not freehold*. Regarded from a positive

point of view, C. included not only all movable property, but all property which, though immovable, was not held on a feudal tenure. Any estate, then, or interest in lands and tenements not amounting to freehold, is a chattel. But as between property thus "savoring of reality" and mere personal movables—money, plate, cattle, and the like—there was a manifest distinction, chattels were, consequently, distinguished into *chattels-real* and *chattels-personal*. Both descriptions of C., in the eye of the ancient law of England, were regarded as inferior to freehold, and formed a subordinate class of property. As distinguished from estates of inheritance, or for life in things immovable, such estate is called *personal*, the others being *real* estate. Till the passing of 8 and 9 Vict. c. 106, livery of seizin was required to pass an estate of inheritance, or for life in corporal hereditaments of feu tenure, but such was no more required for the transfer of a C. real than of a C. personal. A C. *real* is also transmitted on the owner's death to his executor or administrator, like a C. *personal*, and does not descend to his heir like a freehold of inheritance. There is an exception to this rule, however, in the case of chattels which, owing to their intimate connection with property of a freehold nature, cannot be separated from it without injury. Such, for instance, are the muniments of title to an estate, growing grass, deer in a park, and actual fixtures, all of which go to the heir, and not the executor. The tenant of a C. real, like the tenant of a C. personal, is, moreover, said not to be *seized*, like the tenant of a freehold, but to be *possessed*. Lastly, there can be no estate tail in a C. real more than in a C. personal, except in the case in which either of them can be regarded as an heir-loom. Formerly, C. might be disposed of by will at an earlier age than real estates, but this was altered by 1 Vict. c. 26.

CHATTERER, a significant popular name, often applied to the birds of the family *ampelidæ*, a family of the order *insectores* and tribe *dentirostres*, having a depressed bill like that of the fly-catchers (*muscipidæ*), but somewhat shorter and broader in proportion, and slightly arched. To this family belong the cotingas, wax-wings, piaubaus, caterpillar-hunters, etc. They are found chiefly in the warmer parts of the old world, although America also produces some. They inhabit low grounds or forests, feeding chiefly on insects and their larvæ. Some of them possess powers of song almost equal to those of the nightingale. Many of them are birds of gorgeous plumage.—Only one species is British, sometimes called simply the C., sometimes the Bohemian C., or wax-wing (q.v.).

CHATTERTON, THOMAS, an English poet, whose youth, genius, and tragical death have made him one of the wonders of English literature, was b. at Bristol, Nov. 20, 1752. His father, who had once been a chanter in the Bristol cathedral, and also master of a kind of free-school, died two or three months before the poet's birth. C. was educated at a parish-school, was considered a dull child, but, making acquaintance with a black-letter Bible which his mother often used, the dormant spirit flashed up. From early years he was fond of all kinds of antiquities; he clung around old walls like the ivy, and haunted twilight ruins like the bat. At the age of 14 he was apprenticed to Mr. Lambert, an attorney. His situation here was uncomfortable; he took his meals in the kitchen with the footboy, and, when refractory, was chastised with a ruler. In Oct., 1768, the new bridge at Bristol was opened, and C. sent to a newspaper an account, in antique phraseology and spelling, of the ceremonies attending the opening of the old one several centuries before—the whole purporting to be taken from an ancient MS. To a certain Bristol pewterer, Burgum by name, he presented himself, and astonished the craftsman by the sight of a parchment, in which his pedigree was traced back to the Norman conquest, adorned by many a splendid marriage, and many a knightly name. He also exhibited to his friends copies of old poems, which, he said, were composed by one Thomas Rowley, a monk of the 15th century. These matters made some stir in his native city, but not enough to satisfy C., who resolved to fly at higher game. Accordingly, Horace Walpole, at that time collecting additional materials for his *Anecdotes of Painting in England*, received from C. several pages of antique writing, accompanied by a short note. The pretended MS. gave biographical sketches of celebrated painters who had flourished in England several centuries ago, and of whose existence Walpole had never dreamed. Walpole, put off his guard, answered his unknown correspondent at once; expressed his delight at receiving the MS.; and desired, as a personal favor, that all the other antique writings, poems included, mentioned in the note, should be forwarded. C., highly elated, immediately sent accounts of a great many more painters and poets, and also gave some slight sketch of his personal history. On receipt of this second communication, Walpole suspected a trick. The poems he showed to Mason and Gray, who at once pronounced them forgeries; he then wrote C., expressing his suspicions as to the genuineness of the MS., and administering at the same time a great deal of excellent advice. C. replied, desiring that the MS. should be returned at once; but, by the time the letter reached London, Walpole was about to start for Paris, and it was allowed to remain unanswered. On Walpole's return some six weeks thereafter, a fierce note from C. awaited him, the contents of which must have brought the blood to his polished and urbane brow; indignant, he bundled up the MS., and returned it without a word of explanation.

From his earliest youth, C. had a ghastly familiarity with the idea of suicide. Among

his papers preserved in the British Museum, is a last will and testament, "executed in the presence of Omniscience, the 14th of April, 1770," full of the wildest wit and profanity. Another document of similar purport, falling into the hands of his friends, led to his dismissal from Mr. Lambert's office. Released from what he considered the slavery of law, C.'s eyes turned to London, and in that city he arrived, carrying with him all his Rowley MS. and several modern poems, on Tuesday, the 24th April, 1770, and took up his abode with one Walmsley, a plasterer, in Shoreditch. No sooner had he settled there, than he began to work as with a hundred hands. During the last few months of his life, he poured forth squibs, satiric poems, political essays, burlettas, letters in the style of Junius, and meditated writing a history of England, to appear in parts. For a time, his prospects seemed golden enough. He obtained an introduction to lord mayor Beckford; he sent glowing letters home, accompanied by presents to his mother and sisters. Ultimately, he left the plasterer's in Shoreditch, and took lodgings in Brooke street, adjoining Holborn. Unhappily for C., editors of opposition papers were willing enough to insert and praise his articles, but were disinclined or unable to render an equivalent in cash. Possibly they conceived that a patriotism so ardent must be its own reward. The means of life were now fast failing. In desperation, he attempted to procure an appointment of surgeon's mate in a vessel going to Africa, but failed. This was the last drop that made the cup overflow. On Saturday, the 25th Aug., his landlady, alarmed that her lodger did not make his appearance, had the door of his room broken open; saw the floor littered with small pieces of paper, and C. "lying on the bed with his legs hanging over, quite dead." Just at this time, Dr. Fry of Oxford, who had seen or heard something of the Rowley poems, was on the eve of starting for Bristol to make inquiry into the matter. Sad enough to think on now: a little promptitude on the one hand, a little patience on the other, and the catastrophe might have been averted.

C. died before he reached his 18th year, and takes his place as the greatest prodigy in literature. Indeed, in our judgment of him, age cannot be taken into account. He never seems to have been young. His intellect was born fully matured. He was equally precocious in other respects. In his letters, he speaks of the relation of the sexes in the tone of a sated *youé*. He never seems to have felt the delicious shame and ingenuousness of youth; over his heart never was outspread "the bloom of young desire and purple light of love." The *Kew Gardens* is written in the style of Churchill, and it possesses all that master's vigor, and every now and then we come on a couplet turned with the felicity of Pope. His genius, however, is in its greatest perfection in the ancient poems. No poet, before or since, has written a tenderer strain than the lament in *Ælla*, or conceived a bolder image than the personification of freedom in the ode to liberty in his *Tragedy of Godwin*. C.'s life has been written by many hands, but the best and most sympathetic sketch of it is that given by prof. D. Masson of Edinburgh university in his collected essays.—See *The Poetical Works of Thomas Chatterton*, by the Rev. Walter Skeat, M.A. (1875); Watt's essay, *English Poets*, series 1880.

CHATTOO'GA, a co. in n.w. Georgia, on the Alabama border, intersected by the C. river; 331sq.m.; pop. '90, 11,202, includ.colored. The surface is somewhat mountainous. Limestone, marble, lead, and iron are found; and wheat, corn, oats, and cotton are raised. Co. seat, Summerville.

CHAUCEER, GEOFFREY, the father of English poetry, was b. most probably about 1340, though the traditional date is 1328. Recent researches have made it clear that C. was the son of John Chaucer, a London vintner. It has been said that he studied at Cambridge, and afterwards removed to Oxford. While at the university, he wrote *The Court of Love*, and *The Book of Troilus and Cresseide*. At one period he seems to have turned his attention to law, and to have become a member of the Inner Temple. About these matters his biographers, knowing little, have conjectured much. The only particular of C.'s youth of which an anxious posterity can be certified is, that he one day thrashed a Franciscan friar in Fleet street, and was fined two shillings for the exploit on the next. History has preserved this for us, but has forgotten all the rest of his early life, and the chronology of all his poems.

In 1359, C. assures us, on his own authority, that he served under Edward III. in his French campaign, and was therein made prisoner. The date of his return from captivity, and of his subsequent marriage, cannot now be ascertained. He espoused Philippa, youngest daughter of sir Payne Roet, whose estates lay in Hainault. His wife's sister, Katherine, ultimately became the wife of John of Gaunt, duke of Lancaster; and it may be presumed that the high connection thus established aided, in no inconsiderable degree, the poet's advancement in life. After his marriage, he began to mix in public affairs. He was sent on an embassy to Genoa in 1372, and, on that occasion, has been supposed by some to have had an interview with Petrarch, then residing at Padua, and to have heard from his lips the story of *Griselda*. On his return, he was appointed controller of the customs for wools, and in the same year the king granted him a pitcher of wine daily for life. In 1377, C. proceeded to Flanders in the retinue of sir Thomas Percy, afterwards earl of Worcester; and for several years thereafter he was employed assiduously in embassies and other business connected with the public service. 'n 1386, a commission was issued to inquire into alleged abuses in the department of

the customs, and C. was dismissed from his controllership in the Dec. of that year. On meeting this fact, one cannot help remembering that Edward made the writing out of the accounts in C.'s own hand the condition of his holding office. Had the great poet neglected his duties? It has been conjectured by some, that after his disgrace C. became embarrassed in circumstances, and apparently with reason, for about this time he canceled both his pensions, and consigned them to one John Scalby, "to whom they were probably sold under pressure of distress," says his latest biographer. In 1387, C. lost his wife. Where he spent his closing years, cannot now be ascertained. Godwin surmises that in his distress he retired to Woodstock, and composed there *The Canterbury Tales*. It seems, however, to be tolerably certain that during the last years of his life he was resident in London. There he died on the 25th Oct., 1400, aged 74, and was buried in Westminster abbey, the first of the long line of poets whose ashes make that pile so venerable.

C. was a worthy representative of the splendid 14th century. He was a master of the science, the theology, and the literature of his time. He had seen many men and cities, and had formed no inconsiderable unit in imposing ceremonies of state. His poems are numerous, and exhibit every variety of poetical excellence. His earlier performances, such as *The Flower and the Leaf*, *The Romaunt of the Rose*, are, after the French fashion then prevalent, gorgeous allegories full of queens and kings, bowers, beves of beautiful ladies, brave knights, and pious nightingales that sing the praises of God. They appeal potentially enough to the eye, but they do not in the slightest degree touch the heart, or relate themselves to human concerns. Quite different *The Canterbury Tales*, so full of humor, pathos, and shrewd observation. In these tales, English life, as it then existed, is wonderfully reflected—when the king tilted in tournament, when the knight and the lady rode over the down with falcon on wrist, when pilgrimages bound for the tomb of St. Thomas passed on from village to village, when friars sitting in tavern over wine sang songs that formed a remarkable contrast with the services they so piously and sweetly intoned. All that stirring and gayly appareled time—so different from our own—is seen in C.'s work, as in some magic mirror; and in his case, as in every other, when the superficial tumults and noises that so stun the contemporary ear have faded away, leaving behind that which is elemental and eternal, the poet is found to be the truest historian. Among C.'s other writings may be mentioned, *The Book of the Duchess*; *The House of Fame*; and *The Legend of Good Women*. The genuineness of *The Court of Love* and of *The Flower and the Leaf* is denied by Mr. Furnivall, and by Mr. Skeat in his new edition of C. (4 vols., 1878). See J. R. Lowell's essay, in *My Study Windows*.

CHAUCI, an important tribe of ancient Germany, who dwelt between the Elbe and the Ems. Tacitus records that they were conspicuous for their love of peace and justice, being powerful but not ambitious, ready to resist aggression, but never provoking war. They finally merged into the wider designation of Saxons.

CHAUDÉS-AIGUES, a t. of France, in the department of Cantal, about 12 m. s.s.w. of St. Flour. It is celebrated on account of its hot mineral springs, which have the property of discharging grease from sheep's wool, and vast numbers of fleeces are sent hither annually to be washed. Pop. '91, 1674.

CHAUDET, ANTOINE DENIS, 1763-1810; a French artist, whose statue of *Œdipus*, finished in 1801, established for him a high reputation. He also excelled in designing and penciling; and illustrated the works of Racine for Didot. Among his statuary are "Paul and Virginia," "Sensibility," "Surprise," a silver statue of "Peace," and the "Napoleon" that crowned the Vendôme column. His wife, Jeanne Elizabeth Gabion, was his pupil in painting, and produced many fine pictures.

CHAUDFONTAINE, a village charmingly situated in the valley of the Vesdre, a few miles from Liège, in Belgium, and celebrated for a hot spring which supplies water for hot-baths. There are hotels and lodging-houses for the accommodation of visitors. The place is a favorite resort of the Liégeois. There is here a station on the railway from Liège to Aix-la-Chapelle. Pop. 2000.

CHAUDIÈRE, the name of a river and of a lake of Canada. The river joins the St. Lawrence from the s., about 7 m. above Quebec, forming the celebrated falls of its own name, about 2½ m. from its mouth. The lake—merely one of the many expansions of the Ottawa—has on its right the city of that name, the metropolis of the united colony.

CHAUFFEURS, or GARROTTEURS, outlaws during the French reign of terror who roamed over the country in organized bands, under the lead of Johann Buckler, or Schinderhannes. They garroted men and women, and roasted their feet to compel them to disclose treasure. In 1803, vigorous measures were taken which resulted in their suppression.

CHAULIAC, or **CHAULIEU**, GUI DE, a surgeon of France, of the 14th c., who was physician to three of the popes of Avignon. In his profession he was far in advance of the time, and his works are still regarded as important. He is credited with laying the foundation of the modern principles and practice of surgery. One of his works describes the plague or black death of 1348.

CHAUMETTE, PIERRE GASPARD, one of the most extravagant characters of the French revolution, was b., 1763, at Nevers, and made his first public appearance at the Cordeliers' club, where he was introduced by Camille Desmoulins. His "sans-culottism" gained for him such popularity, that he was appointed procurator of the community of Paris, in the place of Manuel. C. was very enthusiastic in favor of the "worship of reason." In his zeal, he rejected his own Christian name, Pierre, as having been sullied by saintly associations, and styled himself "Anaxagoras." The institution of the tribunal of the revolution, the decree for a revolutionary army, and the law against suspected aristocrats, were carried into effect by C. along with others. He also proposed that the whole French nation should be made to wear wooden shoes, and to subsist on potatoes; but this was too much even for the chimerical enthusiasm of his compatriots. His antics, however, in connection with the "worship of reason" excited the disgust of Robespierre, who devised measures for bringing the whole company of actors under Hébert to the scaffold. C. was arrested and imprisoned on a charge of having been implicated in a plot against the convention, and was executed, April 13, 1794.

CHAUMONOT, PIERRE MARIE JOSEPH, 1611-93; a French Jesuit missionary among the North American Indians. His work was chiefly among the Hurons of Canada, among whom he established missions and schools. He left a grammar of the Huron tongue. In 1655, he visited the Onondagas.

CHAUMONT, a t. of France, in the department of Haute-Marne, on an elevation between the rivers Marne and Saïze, about 140 m. s.e. of Paris. It is generally well built, with clean, spacious streets, and fine promenades round the upper part of the town. There are considerable manufactures, including hosiery, cotton, yarn, gloves, etc. On the 1st of Mar., 1814, the allied powers here bound themselves by treaty against Napoleon, in the event of the negotiations at Chatillon ending unsatisfactorily. Pop. '91, 13,280.

CHAUNCEY, CHARLES, LL.D., 1777-1849; son of the Connecticut attorney-general, became a member of the Philadelphia bar, where he won high rank.

CHAUNCEY, OR CHAUNCY, CHARLES, LL.D., 1747-1823; a native of Massachusetts, admitted to the bar in 1768, and settled in New Haven. He was attorney-general of the state, and in 1789, judge of the superior court.

CHAUNCEY, OR CHAUNCY, ISAAC, 1772-1840; a capt. in the U. S. navy. He began sea-faring life in the mercantile service, in which he was conspicuous for enterprise and energy. In 1799, he entered the navy as a lieutenant, and in 1802 was made acting capt. commanding the *Chesapeake*, of 38 guns, the flag-ship of the squadron sent against Tripoli, serving with distinction in that brief war. In 1806, he was made capt., and in the war of 1812 had command on the great lakes. In 1813, he participated in the capture of York, now Toronto, and of Fort George, driving the enemy from the whole of Niagara region. On one occasion he captured five British vessels, and a regiment of troops. In Aug., 1814, he blockaded a British fleet in Kingston harbor until the close of navigation. Before the lake opened again, peace was concluded. In later years he was in command of the navy-yard at Brooklyn, and of the squadron that conveyed an officer to make the treaty of peace with Algiers. At the time of his death he was president of the board of navy commissioners.

CHAUNCY, CHARLES, 1705-87; great-grandson of the president of Harvard, a graduate of that institution, and pastor of the First Church in Boston in 1727. He published many works, among which were *Complete View of the Episcopacy*; *Seasonable Thoughts on the State of Religion in New England*; *Mystery Hid from Ages, or the Salvation of all Men*; and *The Benevolence of the Deity*. He officiated 60 years in one parish.

CHAUNCY, OR CHAUNCEY, CHARLES, 1592-1672; a native of England, educated at Cambridge, where he became professor first of Greek and afterwards of Hebrew. His puritanism involved him in difficulties with the ecclesiastical authorities, and he was fined and imprisoned. In 1638, he emigrated to New England, and was for three years pastor at Plymouth, Mass., and afterwards at Scituate. There having been a change in ecclesiastical policy in England, he was about to return to his vicarage in Ware, when Henry Dunster, the first president of Harvard college, resigned, and the place was offered to Chauncy. He at once accepted (1654), and remained in office till his death. He left six sons, all of whom graduated at Harvard, and all became preachers.

CHAUNTER, the highest pipe of the bagpipe, on which the chaunt, or melody, is played.

CHAUNY, a t. of France in the department of Aisne, about 18 m. w.n.w. of Laon. It is built partly on the right bank of, and partly on an island in, the river Oise, which is here navigable. It is an old, rather uninteresting place, with manufactures of sacking, hosiery, chemicals, and leather, and an active trade. Pop. of commune, '91, 9315.

CHAUSSES, in the armor of the middle ages, were defense-pieces for the legs. Some were made of padded and quilted cloth, with metal studs; some of chain-mail; some of riveted plates; and some of banded mail. It was not unusual to fasten them by lacing behind the leg.

CHAUTAUQUA, a co. in s.s.e. Kansas, formed 1875; drained by Big Caney and Middle Caney creeks, surface level and soil fertile; 651 sq.m.; pop. '90, 12,297. Co. seat, Sedan.

CHAUTAUQUA. This Indian word, the name of a lake and county in south-western New York, has during the past twenty years become associated with a system of popular education now generally known, but by many only vaguely understood.

The fundamental principle of this system is that the higher education may and should be extended to all, young and old, rich and poor, and that education, best begun in academy, college, and university, is not confined to youth, but continues through the whole of life.

Broadly speaking, the influence of Chautauqua is two-fold, and is exerted through the summer assembly directly upon those in attendance, and by means of reading circles and correspondence instruction, upon self-educating readers and students in their own homes. These two plans may be successfully combined, for by supplementing home study during the year with six weeks' residence at Chautauqua in the summer, a conscientious and persevering student may do work of a high grade.

The function of Chautauqua in the educational system of the United States is compensatory and supplementary. While its methods cannot be by any means an adequate substitute for college training, they may stimulate personal development among ambitious people denied college opportunities, and among all classes may encourage habits of systematic reading and study.

THE SUMMER ASSEMBLY. The first Chautauqua assembly (known as the "Sunday-School Assembly") was in session Aug. 4-18, 1874, as the result of a plan formed by Lewis Miller, Esq., of Akron, O., and Rev. John H. Vincent, of New York. Both men were interested in the improvement and development of Sunday-schools. To this end they devised a meeting which should be more than a mere conference of two or three days; but which should include courses of study in pedagogical principles, Biblical analysis, practical questions of school organization and management, extending over a period of ten days or two weeks. The plan also recognized the importance of recreative exercises, and certain lectures of a general character not strictly related to the main subject of Sunday-schools. It was decided to hold this "assembly" in camp, to adopt the unquestionably good features of the so-called camp-meeting, but to give prominence to the calm, earnest, careful study of important principles and methods. Although the plan originated with members of the Methodist Episcopal Church, there was no thought of making the assembly denominational. At the first session all the leading Protestant bodies were represented, and there has never since been any attempt to make distinctions. The attendance in 1874 was gratifyingly large. In spite of primitive lodgings and many discomforts, there was a spirit of enthusiasm which promised well for the success of the experiment. The Sunday-School Normal department provided means for daily study under experienced instructors; prominent speakers gave lectures of a popular character on Biblical themes. A large model of Palestine (300 feet long) was laid out near the lake (which served as the Mediterranean), and students were conducted through this miniature land by Oriental travelers. Thus the Chautauqua assembly began, based on the theory that change of occupation, not idleness, is true recreation, and that the summer vacation may be made a means of development and stimulus to those engaged during the year in the ordinary pursuits of life.

The assembly plans widened rapidly in successive years. The system which had succeeded in the case of Bible study was quickly extended to include science, language (the teaching of Hebrew began in 1875), and literature. Music of a better grade was introduced, and a large chorus was drilled daily. This expansion has continued, until now the staff of lecturers and instructors numbers more than two hundred men and women prominent in all departments of educational life. Every year at least one well-known British scholar is induced to cross the Atlantic especially to lecture at Chautauqua. Gradually progressive courses on some one topic have been substituted for miscellaneous addresses on a great variety of subjects.

In 1876 the session was lengthened to three weeks, and now covers nearly two months.

SUMMER SCHOOLS. In 1879 a school for secular teachers (Teachers' Retreat) was opened with a faculty of efficient instructors. This department has grown steadily in numbers and importance, and is a leading summer school of methods. The same year (1879) the School of Languages (now College of Liberal Arts) began, with courses in German, French, Latin, Greek, Hebrew, and Sanskrit. The development of this school has been marked by important changes, largely due to Dr. William R. Harper, of Yale, president-elect of the new University of Chicago, who became instructor in Hebrew in 1882, and principal in 1885. The college is organized for regular work under professors from Yale, Johns Hopkins, University of Michigan, and other leading institutions. Courses are offered in fourteen departments of language, literature, mathematics, science, history, and political economy. The languages are taught by the "inductive method," a combination of the "natural method" with the old-time thorough drill in the principles of grammar. The student is compelled, in all but a few exceptional cases, to confine his attention to one or two departments. By such concentration the summer student may easily accomplish in six weeks more than a college term's work in one study.

In 1888 THE CHAUTAUQUA SCHOOL OF THE ENGLISH BIBLE was organized with Dr. Harper as principal. This department, designed to promote the study of the Bible as a great literary masterpiece, as well as an inspired volume, was received with imme-

diate favor, and has grown rapidly. In 1890 the college and Bible school enrolled 763 students.

Other Classes. Besides the schools mentioned above, there are twenty classes in music, physical culture, art, etc.

Architecturally the summer city of Chautauqua has kept pace with the progress of the plan. All the schools and classes are provided with suitable buildings; there are public lecture halls of capacity varying from 200 to 5000, a well-equipped gymnasium, museum, etc. A large organ and a chime of eight bells are the permanent property of the assembly.

The revenue of the assembly is collected, like the customs dues of a foreign city, at the gates. No public "collections" are ever taken. A tax is levied on all who enter and become members of the community. Chautauqua carries the municipal idea beyond mere material matters to include public instruction and entertainment. All exercises, except class instruction in the college, are free to any one within the town limits.

THE CHAUTAUQUA LITERARY AND SCIENTIFIC CIRCLE. Probably Chautauqua is best known in connection with this plan of systematic home reading. In 1878 at Chautauqua this plan was proposed and explained. The announcement went out to the press, and the first year 7000 persons were enrolled. From that time, every autumn and winter, readers varying in number from 8000 to 25,000 have joined the circle.

The system was founded in the belief that thousands of ambitious people were only waiting for definite suggestion and aid in reading. The plan consists of: (1) A four years' course of reading, including selections in English from the ancient classics, history, economics, literature, and art. Each year of the four is devoted especially to a great nation, and is known as "The Greek Year," "The Roman Year," "The English Year," or "The American Year." No attempt is made to study language or mathematics. The course is general, and follows in a measure the subjects taught in the average college; it gives what has been called the "college outlook." (2) Certain books, many of them specially prepared by well-known authors, are designated each year by a council of six prominent men. (3) A monthly magazine, *The Chautauquan*, contains supplementary articles on the subjects of the course, by the leading writers of the day, general miscellaneous matter on current affairs, and several departments designed to aid the reader, such as apportionment of the course by the week or month; notes on the books, outlines of reading, word studies, etc. (4) A membership book, sent to each reader, includes analyses of the required books, and question papers (memoranda), to be filled out and returned to the office. These papers are intended to aid the reader in reviewing and systematically arranging the facts and principles he has learned. They are not examinations, nor are they regarded as such. (5) Local circles may be formed in any community where three or more readers desire the benefit of comradeship. There are about 2000 such circles now in active life (1890). (6) A certificate is granted at the end of the course to all who state in writing that they have faithfully read all the required literature. Such certificate has no significance beyond the fact stated, and, of course, has no relation to a degree. (See degrees below.)

The readers enrolling each year are known as a "class," and assume the numeral of the year their course is completed, after the plan of American colleges. This device, and the thought that so many people, in this country and in foreign lands, are reading the same books at the same time, create a certain spirit of fraternity and enthusiasm that contribute to the success of the plan.

For those who have completed the four years' course, or for others, there are many special courses in history, literature, science, and art, which enable a reader who has found a congenial subject in the general course to pursue a specialty. There is also a plan by which these special courses may be directed by correspondence with one or another college professor. The importance of continued reading is always emphasized.

CORRESPONDENCE INSTRUCTION. The general reading course arouses the intellectually apathetic, the special advanced courses offer opportunity for more thorough reading, and the Correspondence College makes real study possible. A number of college professors of unquestioned standing form the faculty, and by frequent communication, question papers, and other means, direct students in all academic branches. It is not claimed that this method is equal to personal contact between pupil and teacher. There is a loss which cannot be compensated, unless the correspondence student can attend the summer classes at Chautauqua or elsewhere. Yet, by devoting more time to the work than the student in residence gives, the persevering and conscientious non-resident student may acquire mental discipline and knowledge which deserve recognition.

The same correspondence plan is applied in the Chautauqua School of Theology, which enables ministers of limited means to continue and complete professional training.

CHAUTAUQUA UNIVERSITY. In 1884 the Chautauqua School of Theology was chartered by the New York legislature, and in 1882 a charter for Chautauqua University was granted. These powers were sought by Chautauqua, not for the sake of a specious dignity and authority, but because its officers believed that there should be in the United States an institution like the University of London, empowered to recognize with degrees the attainments of non-resident students, as shown by rigid and exacting examinations. The conservative policy of the management is proved by the fact, that in eight years less than a dozen degrees (the highest a PH.D.) have been conferred under both charters. No honorary degrees are possible under the rules.

CHAUTAUQUA, a co. in w. N. Y., having lake Erie on the n. and Pennsylvania on the s. and w.; 1020 sq. m.; pop. '90, 75,202. Co. seat, Mayville.

CHAUTAUQUA LAKE, in Chautauqua co., N. Y., 730 ft. above the level of lake Erie and 1382 ft. above the ocean. It is 18 m. long and 1 to 3 wide, with a navigable outlet to Alleghany river.

CHAUVEAU, PIERRE JOSEPH OLIVIER, D.C.L., b. Quebec, 1820. In 1844, he was chosen to the provincial legislature, became solicitor-general in 1851, and provincial secretary in 1853. In 1855 he was appointed superintendent of education for lower Canada. On the organization of the confederation, he became first minister of the government of Quebec, and in 1873 was chosen speaker of the Canadian senate. He became professor of Roman law in Laval University in 1878; was elected president of the Royal Society of Canada; and published poems and other works. He d. in 1890.

CHAUVENET, WILLIAM, LL.D., 1819-70; b. Penn.; a graduate of Yale, and long connected with Alexander D. Bache in magnetic and meteorological observations at Girard college. In 1841, he was appointed professor of mathematics in the navy, and assisted in the establishment of the naval academy at Annapolis and of its observatory, of which he was made director. He was for a time professor of mathematics and astronomy in Washington university at St. Louis, Mo. Among his works are *Manual of Spherical and Practical Astronomy*; *The Binomial Theorem of Exponents and of Logarithms*; and *Plane and Spherical Trigonometry*.

CHAUVIN, ETIENNE, 1640-1725; a minister of the reformed religion, b. at Nîmes. At the revocation of the edict of Nantes, he went to Rotterdam, and in 1695, he was made professor of philosophy at Berlin. His principal work is a *Lexicon Rationale, sive Thesaurus Philosophicus*. He also wrote *Theses de Cognitione Dei*, and started the *Nouveau Journal des Savants*.

CHAUVINISM. "Chauvin" was the name of the principal character in Scribe's *Soldat Laboureur*, played with immense success at the time of the restoration. He represented a bragging veteran of the empire, who was continually talking of his achievements at Austerlitz and Jena, and his determination to take a brilliant revenge for Waterloo. Since then, a *chauviniste* has come to mean a man who has extravagant and narrow-minded notions of patriotism, and enmity towards foreign peoples.

CHAUX DE FONDS, a t. of Switzerland, in the canton of Neuchâtel, 9 m. n.w. of the city of that name. It is situated in a bleak valley, at an elevation of 3070 ft. above the sea, and is scattered over a large area, almost every cottage being surrounded by a garden or croft. It is one of the chief seats of the manufacture of clocks and watches in the canton. The mechanists work chiefly at home, each devoting himself to a particular portion of machinery. This industry employs 12,000 hands. Pop. '80, 22,456.

CHAVES, a t. in Portugal, near the frontier, on a plain near the right branch of the Tamega, which is here crossed by an old Roman bridge of 18 arches; pop. 6000, but formerly as many as 20,000. Its hot saline springs were known to the ancients. In one of its churches is the tomb of Alphonso I.

CHAYENPUR', a fortified t. of Nepaul, in the n. of India, about 120 m. to the e. of Khatmandu, the capital of the state, being in lat. 27° 20' n., and long. 87° 3' east. It is the chief town of a district which yields rice, wheat, cotton, ghee or butter, timber, spices, sugar, tobacco, and pearls.

CHAY ROOT, CHOYA, or SAYAN (*oldenlandia umbellata*), a perennial herbaceous plant of the natural order *cinchonaceæ*, said to be a native both of India and of Mexico. It is cultivated on the coast of Coromandel for the sake of its long, orange-colored roots, the bark of which affords a beautiful red dye. The quality of the bark is said to be improved by keeping it for some years. It is the coloring matter obtained from C. R. which is used to paint the red figures on chintz. C. R. is the Indian madder, and in it some tribes in Ceylon formerly paid their tribute.

CHAZELLES, JEAN MATHIEU DE, 1657-1710; a mathematician and engineer; b. at Lyons. He was for some time employed by Cassini in measuring an arc of the meridian, and finally became hydrographic professor for the galleys at Marseilles. In 1689, he set sail from Rochefort with 15 galleys, cruised as far as Torbay, in England, and took part in the descent upon Teignmouth. C. published many maps and charts in the *Neptune Français*, and traveled to Egypt, where he measured the pyramids. He was made a member of the academy in 1695.

CHAZY, a town and village in Clinton co., N. Y., on the w. shore of Lake Champlain; the village on the Delaware and Hudson railroad; pop. of town, 1890, 2867. One of the mineral products of the township is the C. limestone, of the lower Silurian formation.

CHEADLE, a small but neat market-t. of England, in the moorland district of the n. part of the co. of Stafford, 14 m. n.n.e. of the town of Stafford, 3 m. from the Froghall station on the Churnet valley branch of the North Staffordshire railway, and 4 m. from the Blyth bridge station on the main line from Derby to Crewe. The town is

seated in a pleasant vale, surrounded by hills mostly planted with fir and other trees. The parish church (St Giles) was a very ancient structure, but was rebuilt in 1837-38. A magnificent Roman Catholic church, erected at the sole expense of John, earl of Shrewsbury, was opened in 1846. Pop. '91, 8252.

CHEATHAM, a co. in n.w. Tennessee, on the Cumberland river; 400 sq.m.; pop. '90, 8845, includ. colored. Chief productions, corn, oats, and tobacco. Co. seat, Ashland City.

CHEATING. In the technical language of the English law, C. means the offense of fraudulently obtaining the property of another by any deceitful or illegal practice short of felony, but in such a way as that the public interest may possibly be affected. In order to constitute C., the fraud must be of such a kind as that it could not be guarded against by common prudence. C., in this sense, is an offense at common law, and indictable, which is not the case with imposition in a private transaction. The law of Scotland has no such distinction. See **WEIGHTS AND MEASURES**, **FALSE PRETENSES**. Cheating is defined in American law as "deceitful practices in defrauding or endeavoring to defraud another of his known right, by some willful device contrary to the plain rules of common honesty." Bouvier says: "In order to constitute a cheat or indictable fraud, there must be a prejudice received, or such injury must affect the public welfare, or have a tendency to do so." Courts have held that it is not indictable for a person to obtain goods by false verbal representations of his credit in society, and of his ability to pay for them; or to violate his contract, however fraudulently it may be broken; or fraudulently to deliver a less quantity than was contracted for and represented. To cheat one of his money or goods by false weights or measures has always been an indictable offense. The word "cheat" is not actionable unless spoken of a plaintiff in relation to his profession or business.

CHEAT RIVER, a stream in West Virginia, formed by brooks rising in the Alleghany mountains, flowing through a region rich in iron and coal, and joining the Monongahela in Fayette co. It furnishes abundant water-power, and is in some parts navigable for steam-boats.

CHEBOYGAN, a co. in n. Michigan, forming, with Emmett co., the extreme northern portion of the peninsula; 815 sq. m.; pop. '90, 11,986. Co. seat, Cheboygan.

CHEBOYGAN, city and co. seat of Cheboygan co., Mich.; on the Cheboygan river and the Michigan Central railroad; at the foot of the Straits of Mackinac. It has banking facilities, newspapers, and large lumbering interests. Pop. '90, 6235.

CHECK in England is a money order on any party having funds of the drawer. It must bear a penny stamp, and is payable to bearer on demand. If not presented within a reasonable time the holder shall not claim against the drawer should the banker fail. The banker bears the risk of forgery, unless facilitated by carelessness in drawing. A C. is held as payment of a debt until dishonored on presentation; it is not payable after the drawer's death.

No stamps are now required on checks in the U. S. The term is almost exclusively applied to the drafts used between banks and bankers and their customers. There is in this country a system of marking checks as "good" or "certified," by the banker. These are called "certified checks." The bank upon certification becomes a debtor to the holder, not the drawer. It has been decided in N. Y. that by certifying a check the bank engages, that the signature is genuine and that the maker has that amount of money in the bank which will be retained to meet that check.

CROSSED CHECKS are not known in the U. S. Where it is known to the maker that the payee wishes to deposit in a certain bank, the same effect as in a crossed check may be obtained by endorsing the check on its back for deposit in that bank.

CHECK BANK. See **CHEQUE BANK**.

CHECKERBERRY. See **GAULTHERIA**.

CHECKERS. See **DRAUGHTS**.

CHECKY (Fr. *échiqueté*). In heraldry, when the field or any charge is composed of small squares of different tinctures, generally metal and color, it is said to be checky.

CHEDDAR, a village in Somersetshire, on the s. side of the Mendip hills, 2 m. s. e. of Axbridge, with a level country to the south. It lies at the entrance of a deep rocky gorge, nearly 1 m. long, overhung by stupendous mural limestone precipices, containing caverns—one being 300 ft. long—filled with fantastic stalactites and stalagmites. The celebrated C. cheeses are produced on the rich grass-farms around. The church is supposed to have been built about 1400, and has a sculptured stone pulpit. Pop. of parish about 2,500.

CHÉDOTEL, the pilot of the expedition sent from France in 1598 to the coasts of Nova Scotia, under command of the marquis de la Roche. Arriving at Au Sable Island (90 m. s. e. of Nova Scotia, an uninhabited island 25 m. long by 1 to 1½ wide), 50 men were landed, and the ships departed for the mainland. But weather prevented a landing at the island on returning, and the men were left there seven years. In 1605, they were sent for, and 12 only were found alive.

CHEDUBA, an island off Aracan, in the bay of Bengal, stretching from lat. 18° 40' to 18° 56' n., and from long. 93° 31' to 93° 50' e. Its area is about 240 sq.m., and its pop. 24,000. Along with the adjacent mainland, it was ceded to the British at the close of the first Burmese war. The soil is fertile, yielding rice, tobacco, sugar, indigo, cotton, hemp, and large quantities of a vegetable oil, equally fitted for burning and for varnishing. The principal mineral is petroleum. The coast presents earthy cones, which emit mud and gas, and about 100 years ago a severe earthquake is believed to have extended the limits of the island.

CHEESE is the common form in which the caseine (q.v.) of milk is used in a separate state as an article of food. In new milk, the C. is present in a condition soluble in water, and is generally separated therefrom in a coagulated or clotted form, on the addition of a little rennet (q.v.). In the preparation of C., the milk is gently heated to a temperature of 110° to 112° F., and placed in a large wooden tub, where the rennet is added, and the operation of curdling goes on. In about half an hour, the curd is sufficiently formed. The liquid whey being pressed out, the curd is chopped into small pieces of the size of a walnut with a knife, called a curd-cutter, salt is added, and the fragments of curd introduced into a cloth placed in a cheese-vat or chessart, which is a wooden tub of varying size and shape, perforated at the sides and bottom. The whole is then put under a cheese-press (q.v.), and subjected to great pressure, which consolidates the curd or caseine, and at the same time squeezes out the remaining portions of the whey. After two or three hours, the half-formed C. is turned and re-turned, each time being subjected to renewed pressure, till in about two days it is sufficiently compacted. It is then removed from the cheese-vat, and placed on a shelf in a dry, airy room, where, being repeatedly turned, it gradually dries, and gets aged or seasoned sufficiently for market in about six months. See *illus.*, DAIRY, vol. IV.

When sufficiently dry for use C. still retains from 35 to 44 per cent. of water, and, besides the caseine, contains a greater or less proportion of oil or fat and saline matter—the latter mainly consisting of common salt, originally present in the milk, and also added during the manufacture of the cheese. As an article of diet C. is highly nutritious; but from its costive properties, it is mainly used as a condiment in small quantity after an ordinary meal, and is then serviceable in giving an impetus to the process of digestion. To serve the purpose of a digester C. must be old and partially decayed, or moldy. It then acts as leaven, and causes chemical changes gradually to commence among the particles of food which has previously been eaten, and thus facilitates the dissolution which necessarily precedes digestion.

Cheese is described according to the material used in its manufacture (skimmed milk, whole milk, cream, or a mixture); or according to the method of producing coagulation (spontaneously, or with rennet or acids); or according to the temperature maintained during the process of curdling, or with the manner of ripening, or according to the removal or non-removal of the whey. It may be well to mention briefly the best known cheeses and the distinctive peculiarity of each kind. Cheese made of whole milk includes all the best known English cheeses except *Cream*, *Cheddar*, and *Stilton*. These are the ordinary *Cream*, *Cheddar*, *Cheshire*, *Wiltshire*, *Gloucester*. The well-known Holland cheeses, *Edam* and *Gouda*, and the *Gruyère* of Switzerland (*schweizer käse*), are whole-milk cheeses. The peculiar taste of the Swiss cheeses is due to the herbs used in flavoring them. Full-cream cheese is made from cream-curd drained in a cloth. Of this kind are *Brie*, *Neuchâtel*, *Cream*, *Cheddar*, and *Yorkshire Stilton*. These in general should be eaten fresh. *Pot-Cheese* is made from the curd of sour milk, drained from the whey and made into molds. Hard cheeses are *Cheshire*, *Gloucester*, *Cheddar*, and *Dutch* or *Pineapple cheese*—the last named from the shape of the mold. Cheese made from skimmed milk becomes extremely hard. *Roquefort cheese* is made from goat's or sheep's milk. The ordinary cheese made in American factories is the whole-milk cheese. *Parmesan cheese* (made in Parma, Italy) is made from skimmed milk, the cows being allowed to eat only the finest herbage, and being housed all the year round. Of late, the foreign cheeses have been very successfully imitated in this country, many Swiss having settled here and opened dairies, especially in New Jersey and central New York. The German cheeses, particularly *Limburg*, are made in large quantities in Wisconsin, Ohio, New York, Pennsylvania, Massachusetts, and Michigan. Many farmers have ceased to manufacture C. in their own dairies. The milk is taken to large factories, where it is weighed and emptied into a common receptacle. The processes following are directed by trained superintendents, and the average product is greatly improved. The farmers receive either payment for the milk as brought, or a share in the proceeds of the manufacture. The total cheese-production of the United States is now fully 450,000,000 pounds annually.

Cheese Press. The old method of compressing curd and expelling the whey from it is still employed in some places—the mere piling of weights on the cheese-vat. Sometimes the action of a screw is employed. Among improved dairy implements are now reckoned, however, many ingenious and elegant forms of C. press, generally depending on the action of a lever. Such are Oyston's press and Frazer's horizontal gang-press. Pressing the milk ejects the whey and consolidates the curd into the desired form.

CHEESE-HOPPER, the larva of *piophilæ casei* or *tyrophaga casei*, a small dipterous (two-winged) fly, of the large family *muscides*, the same to which the house-fly, blow-fly etc.

belong. The perfect insect is about a line and a half in length, mostly of a shining black color; antennæ, forehead, and some parts of the legs rufous. It is a pest of dairies and store closets, laying its eggs in cracks or crevices of cheese, the destined food of its larvæ. To preserve cheeses from this pest, it is of advantage to brush or rub them frequently, and to remove all cracked or injured cheeses from large stores, besides keeping them dry and in a well-aired place. The same rules are applicable to their preservation from the other insect larvæ by which they are sometimes infested, of which the most notable are those of the bacon beetle (see *DERMESTES*), and of another species of dipterous fly, *musca sorvina*.

CHEESE MITE. See *MITE*.

CHEESHANTAUMUCK, CALEB, an Indian, b. 1646; the only aboriginal graduate of Harvard college.

CHEE'TAH, CHIT'TAH, or HUNTING LEOPARD, *Felis jubata* or *Cynailurus jubatus*, an animal of the feline family, but differing from all the rest of that family in its longer and narrower feet and less retractile claws, which are also more blunt and less curved. With these peculiarities are associated a greater length of limbs than is usual in feline animals, adapting it to take its prey by running rather than by leaping, and an intelligent and tractable disposition, constituting an additional point of resemblance to dogs; with which, however, the form of the head and the internal anatomy have nothing in common, but are entirely feline. The C. is in size about equal to a leopard, but the body and limbs are longer. It is very widely distributed, being found in Senegal, s. Africa, Persia, India, Sumatra, etc.

CHEEVER, EZEKIEL, 1615-1708; b. in England; came to New England in 1637, and assisted in founding New Haven colony, in which he became prominent as a deacon, a minister, and especially as a teacher. He also taught in Ipswich, Charlestown, and Boston, being at the head of the famous Latin School in Boston for 38 years. He prepared the *Accidence*, a *short Introduction to the Latin Tongue*, and wrote *Scripture Prophecies Explained, in three short Essays*.

CHEEVER, GEORGE BARRELL, D.D., b. Me., 1807; a graduate of Bowdoin college and Andover theological seminary, and in 1832 ordained pastor of a Congregational church in Salem, Mass. He began at an early age to write for the press, contributing prose and verse to the current magazines and quarterlies. The Unitarian controversy attracted his attention, and he wrote a defense of the orthodox system of Cudworth. Temperance also became a leading idea, and in 1835 he published in a Salem newspaper *Deacon Giles's Distillery*, a bitterly satirical allegory which had a wonderful popularity. The author was prosecuted, and sent to prison for a month. After some time passed in European travel he took charge of the Allen Street Presbyterian church in New York city, and soon afterwards gave a series of lectures on the "Pilgrim's Progress" and on "Hierarchal Despotism." After another trip across the sea he became the leading editor of the *Evangelist*, a weekly religious journal in New York, for which he had been a correspondent. In 1846, he became pastor of the Church of the Puritans (Congregational) in New York city, retaining that office until 1868, when the church, whose ground-lease had expired and which was weakened by dissensions, disbanded. His ministry there was amid the fierce debate which preceded the civil war of 1861-65. After that time he was not engaged in the active ministry, and resided at Englewood, N. J. He has written many essays and books, among which are, *Studies in Poetry*; *Lectures on the Pilgrim's Progress*; *Wanderings of a Pilgrim*; *Windings of the River of the Water of Life*; *Voices of Nature*; *Powers of the World to Come*; *God against Slavery*; and *The Guilt of Slavery and Crime of Slaveholding*. He d. in 1890.

CHEEVER, HENRY THEODORE, b. Me., 1814; brother of George B.; a graduate of Bowdoin, and correspondent abroad of the *Evangelist* of New York. He was a Congregational minister in New York, New Jersey, and Connecticut, and secretary and agent of the church anti-slavery society from its beginning.

CHE-FOO, or CHIFU, a seaport t. of n. China, on the s. coast of the gulf of Pih-chih-ti, in the province of Shantung, 30 m. e. of Tang-chow-foo. It was a place of small consequence until, under the treaty of 1858, it was opened to foreign trade as the port of Tang-chow. Pop. about 120,000.

CHEHALIS, a co. in western Washington, on the Pacific; 2104 sq.m.; pop. '90, 9249. Gray's harbor, one of the few places of refuge from the ocean, is in this county. Co. seat, Montesano.

CHEIRANTHUS. See *WALLFLOWER*.

CHEIROL'EPIS, a genus of fossil ganoid fish, peculiar to the Devonian measures, in which eight species have been found. They had large heads, the spine continued in a rudimentary condition, and the body was completely covered with small lozenge-shaped ganoid scales. The first ray of each fin was converted into a strong spine, whose base was loosely imbedded in the flesh. The pectorals and ventrals were largely developed, while the dorsal was small, and situated behind the anal fin. The generic name, meaning "scaly-hand," was given in allusion to the large scaly pectorals.

CHEIROMANCY (Gr. *cheir*, the hand; *manteia*, prophecy), or *PALMISTRY*, a form of divination that professes to read the destiny of an individual by the lineaments of the

hand. In the middle ages, C. occupied the attention of Cardan, Paracelsus, and other eminent men, who elaborated it into a system. It is now, however, the exclusive property of the gypsies, who still find among maid-servants sufficient credulity to make its practice profitable.

CHEIR'OMYS. See **AYE-AYE**.

CHEIRONEC'TES, a genus of marsupial quadrupeds, differing from the opossums chiefly in having webbed-feet and aquatic habits. *C. palmatus* or *C. Yapock*, sometimes called the Yapock opossum, or simply the Yapock, from the South American river of that name, is common in many rivers of Brazil and Guiana. It has a soft woolly fur, the color of the upper parts of the body is gray, with large transverse patches of black, connected with a dorsal black line, the breast and belly white; the tail is long, very thick at the base, tapering to the tip, and, except at the base, covered with scales. The cheek-pouches are very large. Crustaceans are said to form the chief food of this animal, which is interesting as a sort of marsupial representative of the otter.

CHEIROP'TERA. See **BAT**.

CHEIROTHE'RIMUM, the name given by Dr. Kaup to the animal which produced the peculiar hand-like impressions (hence the name, "hand-beast") on the triassic rocks of this country and Germany. The remains of the animal having been found, and its structure made out, this name has given place to the more characteristic one of *labyrinthodon* (q.v.).

CHEKE, Sir JOHN, who deserves to be remembered as one of the revivers of classical literature in England during the 16th c., was born at Cambridge, June 16, 1514. Entering the university of Cambridge, he devoted himself assiduously to the study of Latin and Greek, particularly the latter language, then much neglected in England. He labored earnestly to advance the study of the Greek language and literature; and when the first professorship of Greek was founded in Cambridge by King Henry VIII., about 1540, C. was appointed professor. A new mode of pronouncing Greek which he introduced was assailed by Bishop Gardiner, the chancellor of the university; but notwithstanding, C.'s system prevailed. C. was for a time preceptor of the prince, afterwards Edward VI., whose elevation to the throne secured him rank, wealth, and honor. But being a Protestant, he was stripped of everything when Mary came to the throne, although other lands were given to him on his returning to the Roman Catholic church, which he did to escape burning, the only alternative offered him by Cardinal Pole. His recantation preyed on his mind so much, that he died in the course of the following year, Sept., 1557. He left several works in Latin, and a pamphlet in English; and among his MSS. was a translation of the Gospel by Matthew, exemplifying a plan for reforming the English language by eradicating all words save those derived from Saxon roots.

CHE-KIANG, one of the eastern and maritime provinces of China, the smallest of the eighteen. Situated in the southern portion of the great plain, it is possessed of great fertility, and produces silk, tea, and rice in abundance. Its capital, Hangchow (q.v.), an important and populous city, is the metropolis of the silk districts. "Above is Paradise," say the Chinese; "below are Soo-chow and Hangchow." Both these places were taken by the Taeping rebels in 1860. Ning-po (q.v.) is the principal port of the province. Pop. according to the official returns of 1882, 11,588,692. Area, 39,150 sq. miles.

CHELIC'ERE, or antennal claws, modified antennæ, which, in some of the crustaceans, and in most of the arachnida, serve a purpose corresponding with that of the mandibles of insects in the cutting, tearing, or bruising of food. They move, however, up and down, in a direction contrary to that of the mandibles of insects.

CHEL'IFER, a genus of *arachnida* (q.v.) of the order *trachearia*, and of the family to which, from their resemblance to scorpions without tails, the name *pseudo-scorpions*, or false scoripons, has been given, the true scorpions belonging to the order *pulmonaria*. The genus C. consists of minute species in which this resemblance is very strong. The palpi are elongated and armed with pincers. The species live under the loose bark of trees, in chinks of old furniture, etc. One species, *C. caneroïdes*, about a line and a half in length, is frequently to be seen in old books, herbaria, etc., and is called the *book scorpion*; it is said to be useful as feeding on the insects which are most destructive to books and collections in natural history.

CHELM, or **CHOLM**, a t. of Russian Poland, in the government of the same name, 126 m. s.e. of Warsaw. It is the seat of a united Greek bishop, and has a theological seminary. The Poles were defeated here by the Russians, June 4, 1794. Pop. about 11,670.

CHELMSFORD, the co. t. of Essex, near the center of the co., at the confluence of the Chelmer and the Cann, 29 m. n.e. of London. The town contains factories for making agricultural implements, iron-foundries, breweries, grain-mills and electric-light plants. The town is the seat of assizes and local courts, and has a grammar-school founded by Edward VI. The streets are lighted by electricity. Pop. '91, 11,008.

CHELMSFORD, the Right Hon. **FREDERICK AUGUSTUS THESIGER**, Baron, was born in 1827. At the age of 17 he entered the rifle brigade, and in the following year was transferred to the grenadier guards as lieutenant, and in 1850 attained the rank of major; in 1857, of lieutenant-colonel; in 1863, of colonel; became brigadier-general in 1877, and lieutenant-general in 1882. He served in the Crimean war, in the Indian mutiny campaign, and again in the Abyssinian campaign of 1868. As commander of the forces in Cape Colony he subdued the Kafirs. In 1878 he succeeded to the peerage. In the Zulu war of 1879 he was appointed to the command of the British troops, but was soon recalled; lieutenant of the Tower of London, 1884-89; general, 1888.

CHELO NIA (Gr. *chelōne*, a tortoise), an order of reptiles, corresponding in extent with the genus *testudo* of Linnæus, and of which the most obvious distinguishing character is the inclosure of the whole body in a protective covering connected with the skeleton, so that only the head, the tail, and the limbs are protruded; the limbs, four in number, and all formed on the same plan, are used by some as feet for walking on dry ground, by others as paddles for swimming. The bony covering consists of two principal parts, called the *carapace* and the *plastron*; the carapace serving as a backler for the upper parts, and the plastron for the under parts of the body. The carapace is formed from the ribs, of which there are eight pair, and from the annular parts of the dorsal vertebrae, expanded into plates, which are joined to each other by dentilated sutures, so that the whole acquires great firmness, and the dorsal vertebrae are rendered immovable. The plastron is formed of pieces which represent the sternum or breast-bone, and which are ordinarily nine in number. So compact and strong is the case of some of the tortoises, that it will bear immense pressure without injury, the arched form of the carapace adding to its strength; whilst the creature, destitute of other means of defense, and incapable of flight, finds safety, at least in its mature state, from all enemies but man, by drawing its head, tail, and limbs within the protecting case, which in some, called box-tortoises, has certain plates movable, so as more completely to inclose them. The turtles and other aquatic chelonians cannot thus withdraw their head, tail, and limbs from danger, but the greater activity of their movements compensates for this.

The firmly fixed ribs not admitting of the movements by which respiration ordinarily takes place in other vertebrate animals, the C. gulp down air, which they inhale entirely through the nostrils; first filling the cavity of the mouth by elevating the hyoid bone, and then, by depressing it, forcing the air into the lungs, whilst the inner aperture of the nostrils is closed by the tongue. In other respects, as to aëration and circulation of blood, they resemble other reptiles.

The jaws are not furnished with teeth, but act in a manner more resembling that of the mandibles of birds, being like them hard, sharp, and horny. The food of the C. is various. Some of them, among which are all the land-tortoises, subsist exclusively on vegetable food; some of the aquatic C. pursue and eat other aquatic animals.

All the C. are strictly oviparous. Their eggs are hatched by the heat of the sun alone; they lay a great number at a time, which are covered with a calcareous shell, like those of birds. The eggs of fresh-water tortoises are in some places a lucrative article of commerce, from the quantity of oil which is obtained from them.

The C. are found only in the warmer parts of the world, but their numbers in some places are astonishingly great. None of them can properly be reckoned British, although stray turtles have, in a few instances, been found on the British shores. A few species occur in the southern parts of Europe, and some are found in the temperate parts of North America.

All the species are extremely tenacious of life; they are capable of extraordinary abstinence, and of living long after having sustained injuries which would have been immediately destructive to almost any other animal. They are also remarkable for their longevity. See REPTILES, TURTLE.

Fossil Chelonia.—Foot-tracks on the triassic sandstone of Dumfriesshire were referred by their discoverer, Dr. Duncan, to tortoises. Similar tracks have been noticed in Devonian and oolite strata. Their vagueness, however, does not indicate with any certainty the animals which produced them. The first indisputable evidence of chelonian life occurs in the upper oolite, where the remains of several pond-tortoises and two or three turtles have been observed. In the newer deposits, they increase in number, so that between 70 and 80 species have been described from the tertiary strata. In the eocene deposits of the London clay, at the mouth of the Thames, there occur the remains of more species of true turtles than are now known to exist in the whole world. Some of these fossil C. were of a size proportioned to their colossal companions; as, for instance, the gigantic land tortoise (*colossochelys*) of the Sewalik hills, whose carapace was as much as 20 ft. in length.

CHELSEA, a city in Suffolk co., Mass.; pop. '90, 27,909, a suburb of Boston, with which it is connected by ferry, and electric and steam railroads. C. is separated from East Boston by C. creek, and from Charlestown by Mystic river, which is crossed by a bridge 3,300 ft. long. The principal public buildings, besides churches, are the city hall, the U. S. marine hospital, Soldiers' Home, Fitz Public Library, odd fellows' and masonic halls. C. is in the Boston customs district, and there are some manufactories in the city; but the business of many of the inhabitants is in Boston. It has the

usual civic government of mayor, aldermen, and common council; with police, fire, and water departments, board of education, etc. C. was settled in 1630 under the name of Winnisimmet, and was a part of Boston until 1738, when, with adjacent settlements, it was organized as the town of C. It was incorporated as a city in 1857. The present towns of Winthrop and Revere were formed from a part of C. The principal manufactures are rubber goods, foundry and machine-shop products, curried leather, cordage, shoes, fire hose, brass goods, stoves and furnaces, tiles, pottery, etc.

CHELSEA, a suburb of London, in Middlesex, on the left bank of the Thames, $4\frac{1}{2}$ m. w.s.w. of St. Paul's. The river is here crossed by a fine iron bridge. Many of the nobility and gentry formerly resided at C., and some of its coffee-houses were much resorted to by pleasure-parties in the 17th and 18th centuries. It contains the famous Chelsea Hospital (q. v.) for superannuated soldiers, also an asylum founded in 1801 for the maintenance and education of the children of soldiers. Since 1885 the limits of C. have been reduced. Pop. '91, 96,272.

CHELSEA CHINA, chinaware made at Chelsea, 1745-1784; its leading marks are an anchor or triangle.

CHELSEA HOSPITAL is an asylum for disabled or superannuated soldiers. The building was commenced in 1609, as a Protestant theological seminary, by Dr. Matthew Sutcliffe, dean of Exeter; and James I. gave it a charter in 1610, as *King James's college*. When Sutcliffe died in 1629, the building was less than half finished, and the students were only 15 in number. Shortly after this the scheme was abandoned, and the building used for various purposes. It was then rebuilt, and made into an hospital for disabled soldiers by Charles II. By a warrant issued in 1684, one day's pay per year, and two in leap-years, were deducted from soldiers' pay, for supporting C. H. This deduction has long ceased; the hospital being maintained by parliamentary grant. The hospital has accommodation for about 600 persons besides officers. Attached to it are about 40 acres of land, used as public gardens and exercise ground. It is governed by a board of commissioners, comprising *ex officio* the lord president of the council, the first lord of the treasury, and the secretaries of state; but the more immediate management is in the hands of about 120 persons, of whom 20 are military officers, 20 civil officers, and the rest subordinates.

The establishment is maintained for the *in-pensioners* of the British army, who are between 500 and 600 in number. These in-pensioners, besides board, lodging, clothing, washing, medical aid, etc., receive a small sum in money, varying from 5s. 3d. per week for a color-sergeant, down to 7d. per week for a private soldier. They are all dressed in uniform—red with blue facings—and are treated as a garrison, in respect to guards, sentinels, etc. There is a certain degree of choice open to the men, as to whether they will be *in* or *out* pensioners. The out-pensioners, who are more than a hundredfold as numerous as the others, receive sums of money varying from 1½d. to 3s. 10d. per day for life, as a reward for past services. Vacancies in the hospital are filled up once a quarter; and every person admitted must give up his out-pension before he can become an in-pensioner. The cost of maintaining the institution is very heavy, and doubts have frequently been expressed as to the usefulness of this expenditure.

CHELTENHAM, a municipal borough, parliamentary borough, and fashionable watering place in the co. of Gloucester, 8 miles n.e. of the city of Gloucester. It lies in a picturesque and healthful valley, on the Chelt, a small stream which rises in the adjacent hills, and flows into the Severn. It is sheltered on the e. and s.e. by a semicircle of the Cotswold hills. It is a very ancient town and in the 16th century sent two members to parliament, but was relieved from that burden in the reign of Queen Elizabeth. During the 18th century its prosperity increased, chiefly owing to the discovery of its mineral springs, of which there are several varieties. They are mainly saline with traces of iron and iodine. George III. visited C. in 1788, after which it continued to be a fashionable resort for many years. In 1893 an effort was made to restore the spas. The city has fine public promenades, gardens, terraces, and spacious squares. It has become famous for its colleges and schools, among which are: the grammar school founded in 1574, Cheltenham college, training colleges for school teachers, the Dean Close Memorial School, and many private schools. The Cotswold Hunt has its seat here and draws many visitors during the hunting season. There are schools of science and art, winter gardens, a fine public library, baths, and recreation grounds. Its growth during the 19th century has been very marked. In 1804 it had but one street, and contained 3076 inhabitants. According to the census of 1891, the population of the municipal borough was 42,900; of the parliamentary borough, 49,800. It returns one member to parliament.

CHEMIC, is the name given to BLEACHING POWDER by those engaged in chemical works.

CHEMICAL NOMENCLATURE AND NOTATION. In early times chemical substances were named according to the fanciful theories of alchemy (q. v.). Thus the name *flowers*

of sulphur was applied to the sublimed sulphur, which grew or sprang like a flower from sulphur when heated; *spirit of salt*, to hydrochloric acid, the corrosive acid or spirit obtained from common salt; and a multitude of other names had a like fanciful origin. In 1787, Lavoisier founded the system of nomenclature which is followed still by chemists. At first, it was intended that the names of simple as well as compound substances should be regulated by system. Hence, such terms as oxygen (from *oxus*, acid, and *gennao*, to produce), the *acid-producer*, given from the notion then held that no acid was without oxygen; and hydrogen (from *hydor*, water, and *gennao*), the *water-producer*, from the supposition that hydrogen had more to do with the formation of water than any other element. The advance of chemistry, however, has so completely changed the opinion of chemists regarding the simpler bodies, that such names are now found to mislead; and thereafter, though such as had been given on this system were retained, their meaning has been discarded, and the systematized nomenclature restricted to compound substances. A remnant of the system, however, still subsists at the present time, in making the scientific names of all the metals end in *um*. In the non-metallic elements, a close analogy exists between chlorine, bromine, iodine, and fluorine; and to indicate this, the common termination *ine* has been given; and for a similar reason, carbon, silicon, and boron, end in *on*. As a general rule, however, the chemical name of an elementary substance does not convey any scientific meaning, and must be regarded as a simple mark or designation, analogous to the names of persons, which give no notion regarding their moral character or physical development. The ancient and more common metals retain their popular titles, such as gold, silver, and copper; but the more recently discovered metals have names given which end in *um*. The symbol of an element is obtained from the first letter of its Latin name, as O for oxygen; Pb for lead (Lat. *plumbum*). When the names of two or more elements commence with the same letter, a smaller letter or satellite is attached to one or more of these; such as S for sulphur, Se for selenium, and Si for silicon. For a complete table of the symbols of the elementary substances, see ATOMIC WEIGHTS.

The name of a compound substance generally indicates the elements of which it is composed. Thus the name oxide of iron indicates that the red powder (rust) is made up of oxygen and iron; the sulphide of lead (galena), that it is composed of sulphur and lead. In all similar combinations—

Oxygen	forms oxides.
Chlorine	“ chlorides.
Bromine	“ bromides.
Iodine	“ iodides.
Fluorine	“ fluorides.
Nitrogen	“ nitrides.
Carbon	“ carbides or carburets.
Sulphur	“ sulphides or sulphurets.
Selenium	“ selenides or seleniurets.
Phosphorus	forms phosphides or phosphurets.

When two elements combine with each other in more than one proportion or equivalent (see ATOMIC THEORY and ATOMIC WEIGHTS), the names of the compound bodies are contrived so as to express this. The term *protoxide* is applied to a compound of one equivalent of oxygen with one equivalent of another element; *deutoxide* to a compound containing a larger proportion of oxygen than the protoxide; and *tritoxide* when the oxygen is still further increased. The term *binoxide* is used when oxygen is present in the proportion of two equivalents to one equivalent of the other element; and *teroxide* when the proportion is as three to one. A *suboxide* contains less than one equivalent of oxygen; and a *peroxide* is the highest oxide not possessing acid properties. The same prefixes are applied to the compounds of chlorine, sulphur, etc.

When one element combines with another to produce several compounds possessing acid properties, various terminations are employed to distinguish the compounds. Thus, oxygen combines with a number of the elements to produce with each a series of acid compounds, the more *highly* oxidized of which receive the termination *ic*, whilst those containing *less* oxygen end in *ous*. Thus, sulphuric acid contains three equivalents of oxygen to one equivalent of sulphur; and sulphurous acid, two equivalents of oxygen with one equivalent of sulphur. These terminations are qualified by the use of the prefixes *hypo* (under) and *hyper* (over). Thus, *hyposulphuric* acid is applied to a compound containing less oxygen than the sulphuric acid, and *hyposulphurous* to one with less oxygen than sulphurous acid.

When acids combine with bases or metallic oxides to form salts, they produce compounds, the names of which are influenced by the terminations of the acids. Thus, sulphuric acid and soda form the *sulphate* of soda; sulphurous acid and soda, the *sulphite* of soda; and *hyposulphurous* acid and soda, the *hyposulphite* of soda. In the same manner, nitric acid with potash forms the *nitrate* of potash, whilst *nitrous* acid and potash produce the *nitrite* of potash.

If a symbol be employed alone, it represents one equivalent of the element. Thus, O signifies one equivalent, or sixteen parts by weight, of oxygen; C, one equivalent, or twelve parts by weight, of carbon; H, one equivalent, or one part by weight, of hydrogen. The

combination of two elements is represented by placing the symbols for those elements side by side; thus, H_2O signifies two equivalents of hydrogen and one equivalent of oxygen in a state of chemical combination (viz., water); and NaCl is one equivalent of sodium (Lat., *natron*), united with one equivalent of chlorine (viz., common salt).

When two or more equivalents of one element unite with one or more equivalents of another element, the number of such equivalents is signified by a small figure being placed immediately after the symbol of the element so multiplied. Thus, H_2O_2 represents two equivalents of hydrogen in combination with two equivalents of oxygen (peroxide of hydrogen); MnO_2 is one equivalent of manganese with two of oxygen (black oxide of manganese); Fe_2O_3 is two equivalents of iron with three equivalents of oxygen (rust); and Pb_3O_4 is three equivalents of lead with four equivalents of oxygen (red lead).

In expressing the formula of a compound substance, the symbol of the metal or its analogue is placed first in order, and is succeeded by the oxygen, chlorine, or similar element. Thus, the symbol for the chloride of mercury is always written HgCl_2 , never Cl_2Hg . The same order is carried out in the construction of the formula of more complex substances; the metallic half is placed first. Thus, sulphate of iron—containing sulphuric acid and the oxide of iron—is always expressed as FeSO_4 , never SO_4Fe . In other words, the symbols are written in the order in which the substances would be named in Latin.

In the construction of the formulas of complex substances, the comma (,) and *plus* sign (+) are often introduced; the former to separate the symbols of substances which are closely united together, and the latter to form a line of demarcation where the components are less intimately combined. Thus, $\text{FeSO}_4 + \text{K}_2\text{SO}_4$ represents the compound of the sulphate of iron with the sulphate of potash; $2\text{KCl} + \text{PtCl}_4$ is the double chloride of potassium and platinum.

Large figures placed at the left hand of a formula multiply all the symbols till a comma or plus sign appears. Thus, $3\text{H}_2\text{SO}_4$ represents three equivalents of sulphuric acid; 3PbO_2 is three equivalents of oxide of lead, and one equivalent of acetic acid; and $\text{K}_2\text{SO}_4 + \text{Al}_2(\text{SO}_4)_3 + 24\text{H}_2\text{O}$ (alum) is one equivalent of the sulphate of potash, with one equivalent of the sulphate of alumina, and 24 equivalents of water. When a compound substance requires to be multiplied, it is inclosed within parentheses, and a large figure placed immediately before it; thus $3(\text{K}_2\text{C}_2\text{O}_4) + \text{Fe}_2(\text{C}_2\text{O}_4)_3 + 6\text{H}_2\text{O}$ represents three equivalents of oxalate of potash, one equivalent of oxalate of iron, and six equivalents of water.

In expressing the formulas of organic compounds, the symbols are written in the following order: CHNO . Thus, turpentine is $\text{C}_{10}\text{H}_{16}$, alcohol is $\text{C}_2\text{H}_5\text{O}$, and morphia is $\text{C}_{17}\text{H}_{19}\text{NO}_3$.

Arbitrary symbols are occasionally used to represent important complex substances. Cyanogen is known as Cy ; the organic acids are recognized by their initial letter with the sign (—) drawn above, as T for tartaric acid, $\text{C}_4\text{H}_4\text{O}_6$; A for acetic acid, $\text{C}_2\text{H}_4\text{O}_2$; and O for oxalic acid, $\text{H}_2\text{C}_2\text{O}_4$; while the alkaloïds are represented by their initial letter or

letters with the sign (+) above; thus, $\overset{+}{\text{Sr}}$ for strychnine, $\text{C}_{21}\text{H}_{22}\text{N}_2\text{O}_3$; $\overset{+}{\text{Mo}}$ for morphia, $\text{C}_{17}\text{H}_{19}\text{NO}_3$; and $\overset{+}{\text{Q}}$ for quinine, $\text{C}_{20}\text{H}_{24}\text{N}_2\text{O}_4$.

Occasionally, in treatises on mineralogical chemistry, arbitrary modes of expressing the composition of minerals are resorted to, which it is not necessary here to explain.

CHEMICAL TOYS, which in the course of recent years have been brought prominently before the public, deserve a brief notice. "Pharaoh's serpents," which are described in the article **SULPHOCYANOGEN**, are highly poisonous, and during combustion evolve dangerous vapors. *Larmes du Diable*, or "crocodiles' tears," are formed of metallic sodium, burn with extreme violence if thrown into water, or even if moistened with water or heated, and scatter particles of caustic alkali, which may inflict serious burns. "Sunshine in winter evenings," "fiery swords," etc., are formed of magnesium, and, like the preceding, may cause serious burns. Pyroxylin, which is identical with gun-cotton, is the active agent in the various toys known as "will-o'-the-wisp paper," "parlor lightning," "fireflies," etc. The use of these toys in teaching rudimentary chemistry to children and young persons is quite incommensurate with their danger.

CHEMISTRY is that branch of natural science which takes cognizance of the changes that bodies undergo when they are influenced by affinity (q.v.). Changes that do not alter the nature and properties of substances—such as the falling of a body by gravity, or its expansion by heat—belongs to physics or natural philosophy. In chemical changes, again, the properties of the substances are permanently altered. Thus, when a piece of iron is left exposed to damp air, it is after a while converted into a reddish brittle substance (rust), owing to the union with it of the oxygen of the air. Chemistry, then, may be most simply defined as that branch of natural science which considers (1.) The combination of two or more substances to form a third body, with properties unlike either of its components; and (2.) The separation from a compound substance of the more simple bodies present in it: and considering that the steps of the combination and decomposition of substances can never be correctly understood without an intimate

knowledge of the properties of substances, it follows that the science of C. must likewise take into notice the description of all the simplest as well as the most complex bodies. See ELEMENTS, CHEMICAL.

When the science of C. is considered as a whole, including the properties of all the elements or substances, and the combinations and changes which they can under all circumstances undergo, it is distinguished by the title of *pure, theoretical, or philosophical C.* Particular departments of C., where the science is confined to the examination of special objects, receive distinctive names; as *physical C.*, or *chemical physics*, which considers phenomena bordering on natural philosophy and C.; *mineralogical C.*, which takes cognizance of the composition of minerals; *physiological C.*, which includes the changes which food undergoes in its transit through the animal economy, and the transformations that take place in organic substances generally; *medical C.*, which considers the composition and compounding of medicines; *agricultural C.*, which relates to the composition of soils and manures, the ingredients in plants, and the best modes of supplying the food they require, etc. *Inorganic or elementary C.* takes cognizance of mineral matter, and the changes it undergoes, whilst *organic C.* is the chemistry of the carbon compounds.

C. ranks as one of the arts as well as one of the sciences, and the division of *practical C.* comprehends the rules, processes, and mechanical means which must be adopted, for the successful prosecution of the art. Practical C. is subdivided into *analytical C.* (see ANALYSIS), which is occupied with the separation of simple substances from more complex—as chlorine (Cl) and sodium (Na) from the chloride of sodium or common salt (NaCl)—and to the estimation of the quantities of the several ingredients; and *synthetical C.* (see SYNTHESIS), which has for its object the union of simpler bodies to form more complex—as hydrogen (H) and oxygen (O) to form water (H₂O). The art of *assaying* (q.v.) is a department of analytical chemistry. *Applied C.* includes the art of manufacturing the various substances employed in commerce and in domestic life, so far as chemical processes and application are required. It is subdivided into *technical C.*, which relates to everything connected with the arts and manufactures; and *pharmaceutical C.*, which takes cognizance of the substances used in medicine.

History.—The Egyptians appear to have possessed the greatest amount of chemical knowledge of all the nations of antiquity. They preserved dead bodies by embalming (q.v.), fixed colors in silk by means of mordants, prepared many medicines and pigments, as also soap, beer, vinegar, metals and metallic alloys, common salt, vitriol, soda, sal-ammoniac, glass, enamel, tiles, and painted earthenware. The Chinese were very early acquainted with the processes for dyeing, and the preparation of metallic alloys, the fabrication of niter, sulphur, gunpowder, borax, alum, porcelain, verdigris, paper, etc. From the Egyptians, the Greeks and Romans derived what chemical knowledge they possessed; but they added little or nothing; and when the migration of the northern tribes, and overthrow of the Roman empire, took place, a stop was put for a time to the advancement of all science in Europe. The prosecution of chemical knowledge was taken up by the Arabs before the 8th c., and was carried on by them and by their European scholars, the alchemists, with the results described under ALCHEMY. The first germs of a real science of C. seem to appear about the end of the 17th and beginning of the 18th c., in the speculations of Becher (q.v.) and the phlogistic theory of Stahl (q.v.). After this, C. rapidly advanced. In 1718, Geoffrey brought out the first table of *affinities*; in 1732, Boerhaave published many original experiments on the chemical relations of heat and light; in 1724 Hales, and in 1756 Black, published researches on the air and æriform bodies, showing that the carbonic acid evolved during fermentation, respiration, and by the action of acids on chalk, was different from atmospheric air. In 1754–59, Margraff added to the then known earths—lime and silica—two others, alumina and magnesia; he also extracted sugar from plants. In 1770, Priestley began to announce his discoveries of oxygen, ammoniacal, hydrochloric, and sulphurous acid gases, etc. In 1773–86, Scheele contributed chlorine, hydrofluoric, prussic, tartaric, and gallic acids; also baryta, phosphoric acid from bones, etc., and gave the first hints regarding a new doctrine of combustion. About the same time Bergman and Cavendish enlarged our knowledge of the gases. Lavoisier, between 1770 and 1794, reorganized much of the then known C., and founded a system of C. which still remains as the skeleton of the science. Berthollet, in 1787, contributed much to the doctrine of affinity, and made researches in chlorine, etc. Fourcroy and Vauquelin advanced organic C.; Klaproth gave many contributions to mineral C. Richter devoted himself to the doctrine of combining proportion, which was afterwards perfected by Dalton, as noticed under atomic theory (q.v.). The discovery of galvanic electricity by Galvani, and its advancement by Volta, led sir Humphry Davy, and others, to important researches in the metals and gases. Gay Lussac and Thenard advanced our knowledge regarding organic substances and the chemical relations of heat. Berzelius made laborious researches in mineral C., and gave an exactness to this department which is matter of astonishment to the chemists of the present day. He was also the author of the electro-chemical theory, which has been almost perfected by the labors of Faraday, De la Rive, Becquerel, etc. Organic C. has latterly advanced most rapidly under the researches of Liebig, Woehler, Mitscherlich, Mulder, Laurent, and others. See AFFINITY; ATOM; ATOMIC THEORY; ATOMIC WEIGHTS.

UNIVERSITY OF ILLINOIS
URBANA

It is impossible within the limits of this article to do more than briefly describe some of the most important of the numerous changes which have been introduced into the science of chemistry within the last few years.

1. The system of measuring temperature, lengths, weights, and volumes has been altered. The Centigrade has completely superseded the Fahrenheit thermometric scale in all recent chemical works, and the French metric (which is a decimal) system has been adopted for all measurements and weights, inches and their fractions being replaced by 10ths or 100ths of a meter, and grains by grams. It has this advantage over all the other systems, of possessing one fundamental linear unit, from which all the ramifications of linear, superficial, or solid dimensions, and of weight are derived. See METRIC SYSTEM. Chemists have long felt the want of an appropriate *volume*, with its corresponding weight, to serve as standard units of measurement, and prof. Hofman has selected 1 cubic decimeter = 1 liter, as the most appropriate unit of volume, and the weight of this measure of pure hydrogen as the unit of weight, hydrogen being taken at 0° C. temperature, and 0^m76* pressure. To this standard *weight-unit*, which = 0.0896 of a gram, he assigns the name of *crith*, from the Greek *krithê*, a barley-corn, signifying figuratively a small weight; and the weight is now in universal acceptance amongst modern chemists. There is probably no figure in chemical science more important than this one (0.0896 of a gram) to be remembered and kept ready for calculation; for it is the standard multiple or co-efficient by means of which the weight of 1 liter of any other gas, simple or compound, is computed. "For example, the relative volume-weight of chlorine being 35.5, that of oxygen 16, and that of nitrogen 14, the actual weights of 1 liter of each of these elementary gases at 0° C. and 0^m76 pressure, may be called respectively 35.5 *criths*, 16 *criths*, and 14 *criths*. So again with reference to the compound gases, the relative volume-weight of each is equal to half the weight of its product-volume. Hydrochloric acid (HCl), for example, consists of 1 volume of hydrogen + 1 volume of chlorine = 2 volumes, or by weight, 1 + 35.5 = 36.5 units; whence it follows that the relative value-weight of hydrochloric acid gas is 36.5

$\frac{36.5}{2} = 18.25$ units; which last figure therefore expresses the number of *criths* which 1 liter of hydrochloric acid gas weighs at 0° C. and 0^m76 pressure, $18.26 \times 0.0896 = 1.6352$ as the actual weight in grams of hydrochloric acid gas. Again, as the product volume of water gas (H₂O),† taken at the above temperature and pressure, contains 2 volumes of hydrogen + 1 volume of oxygen, and therefore weighs 2 + 16 = 18 units, the single

volume of water gas weighs $\frac{18}{2} = 9$ units, or substituting as before the concrete for the abstract value, 1 liter of water-gas weighs 9 *criths*; that is to say, 9×0.0896 gram = 0.8064 gram."—*Op. cit.* p. 131. In concluding this subject we will only further remark, that when a closely approximative result suffices, the *crith* may be estimated at 0.09 gram.

2. Such terms as *atomic weight*, *atom*, and *molecule* are now employed in a stricter sense than formerly. Every element has been held from the time of Dalton to have a number called its atomic weight. This number, according to Dr. Frankland, one of our most distinguished modern chemists, is made to represent, as far as possible: 1st, The smallest proportion by weight in which the element enters into or is expelled from a chemical compound—the smallest weight of hydrogen so entering or leaving a chemical compound being taken as unity. 2d, The weight of the element in the solid condition which contains, at any given temperature, the same amount of heat as seven parts by weight of solid lithium at the same temperature. 3d, The weight of the element which, in the form of gas or vapor, occupies, under like conditions of temperature and pressure, the same volume as one part by weight of hydrogen."—*Lecture Notes for Chemical Students*, 1866, p. 2. Recent investigations have led chemists to assign to many of the elements double the atomic weights that were previously assigned to them.‡ Thus, taking as formerly the atomic weight of hydrogen as the unit, the atomic weight, or, as it is now often styled, the *atomic number* of oxygen is changed from 8 to 16, that of carbon from 6 to 12, that of sulphur from 16 to 32; and this doubling is by the latest writers extended to most of the elements except the halogens, nitrogen, phosphorus, boron, the metals of the alkalies, gold, and silver. The old atomic weights are still recognized as *combining* or equivalent numbers. The reason why this doubling of the number has been adopted will be presently given. The distinction between an *atom* and a *molecule* must be clearly recognized. "We may define an *atom* of an elementary body to be the smallest proportional weight thereof which is capable of existing in *chemical combination*; and we may define the *molecule* of an elementary body to be the smallest proportional weight thereof which is capable of existing in the *free* or *uncombined state*." This, which is Hofman's definition (*Modern Chemistry*, p. 157), is now generally accepted. Thus a molecule (or *elementary molecule*, as it is often termed) may consist either of an isolated atom, or of a group of atoms.

* It is almost unnecessary to notice that 0^m76 signifies 0.76 of a meter, or nearly 30 inches—the ordinary atmospheric pressure at the level of the sea, and at lat. 51½°.

† The reason why the formula H₂O, instead of HO, for water is used, will be presently explained.

‡ The article "Atomic Theory" in the body of the work has been rewritten in accordance with the new views.

The bulk of a molecule, or the *molecular volume* of an element in the gaseous or vaporous state, is the same as the molecular volume of hydrogen at the same temperature and pressure, and in a large number of cases the *molecular weight* of an element is twice its atomic weight. Dr. Frankland gives the following list of the elements whose molecular volumes have as yet been determined: The molecules of mercury, cadmium, and zinc contain *one* atom, and are termed *monatomic molecules*; those of hydrogen, oxygen, chlorine, bromine, iodine, fluorine, nitrogen, sulphur, and selenium contain *two* atoms, and are termed *diatomic molecules*; the molecules of oxygen, as ozone, contain *three* atoms, or are *triatomic*; while those of phosphorus and arsenic are *tetramolecular*, and those of sulphur under certain conditions are *hexatomic*. Thus an element, as in the cases of oxygen and sulphur, may, under different conditions, have two distinct molecular weights.

3. We shall now proceed to explain the reasons why many of the atomic weights have been doubled. "It is obvious," says Dr. Odling, in his elaborate article on "Atomic Weights" in *Watts's Dictionary of Chemistry*, vol. i. p. 456, "that the atomic weights of an element and of its combinations should be selected so as to express the entire series of combinations by the simplest series of formulæ; so as best to accord with the chemical properties and metamorphoses of the bodies; so as best to illustrate their analogies with other bodies; and so as to be in relation with their physical properties, such as their specific volumes, specific heats, isomorphism, etc." We shall endeavor to show how he applies these views to prove that, in the case of oxygen, 16 parts of that element, or the quantity thereof which unites with 2 atoms of hydrogen, is the smallest proportion of oxygen that can enter into a combination. "We find, in the first place," says Dr. Odling, "that the quantity of oxygen contained in the great majority of definite oxidized compounds must necessarily be represented by 16, or some multiple of 16 parts. Thus, the molecules of all hydrates, double oxides, acids, oxysalts, aldehydes, ketones, alcohols, oxyacid-ethers, and a great number and variety of other compounds, doubtless forming together 99 per cent of all known compounds of oxygen, cannot be represented save with 16 parts, or some multiple of 16 parts of oxygen. For example, the molecules of *hydrate of potassium*,* *benzoic aldehyde*, *acetone*, *chloral*, *hypochlorite of sodium*,* etc., each contain 16 parts of oxygen. The molecules of *spinelle*, *brown hematite*, *camphor*, *benzile*, *acetate of sodium*,* *benzoic acid*, etc., each contain twice 16 parts of oxygen. The molecules of *nitric acid*, *glycerin*, *chlorate of potassium*,* *salicylic acid*, *augite*, etc., each contain three times 16 parts of oxygen. We need not carry the quotation further, it being sufficient to remark that Dr. Odling gives similar lists of substances whose molecules each contain 4, 5, 6, 7, etc., times 16 parts of oxygen. Hence it follows that when two bodies only differ in composition by the different proportions of oxygen which they contain, that difference amounts to 16 parts, or some multiple of 16 parts of oxygen. This is well shown in the two following series of bodies given by Odling, in the former of which the symbols are arranged according to modern views:

KCl,	Chloride of potassium.	C ₂ H ₄ ,	Ethylene.
KClO ₂ ,	Hypochlorite of potash	C ₂ H ₄ O ₂ ,	Aldehyde.
KClO ₄ ,	Chlorite of potash.	C ₂ H ₄ O ₄ ,	Acetic acid.
KClO ₃ ,	Chlorate of potash.	C ₂ H ₄ O ₆ ,	Glycolic acid.
KClO ₅ ,	Perchlorate of potash.	C ₂ H ₄ O ₈ ,	Glyoxylic acid.

It is obvious that in both these series each term differs from the preceding one simply by O₂, or 16 parts of oxygen. Again, the quantity of oxygen which can be liberated by any reaction, and which, either alone or in the form of water, can be added to or separated from a compound, must be 16, or some multiple of 16 parts. Thus, each molecule of nitrate of soda, NaO.NO₃, when decomposed by heat, yields nitrate of soda, NaO.NO₃, and O₂ (or 16 parts of oxygen); similarly, each molecule of permanganate of potash, when decomposed by sulphuric acid, yields manganese alum, and O₄ (or twice 16 parts of oxygen); and each molecule of chlorate of potash, KO.ClO₃, is decomposed by heat into chloride of potassium, KCl and O₆ (or three times 16 parts of oxygen). Again, water (and consequently its main constituent, oxygen) is always eliminated in double or some higher even atoms. Thus, formic acid, C₂H₂O₄, yields carbonic oxide, C₂O₂, and two atoms of water, H₂O₂; alcohol, C₂H₆O₂, yields olefiant gas, C₂H₄, and two atoms of water, H₂O₂; oxalate of ammonia, NH₄.C₂HO₄, yields cyanogen, C₂N₂, and four atoms of water, H₂O₄; and innumerable additional examples might be given. On these grounds (and many additional ones might be adduced if space permitted) it becomes obvious that if the vast majority of oxidized bodies were correctly formulated, they would be represented more simply by the formulæ in which O = 16 than by the formulæ in which O = 8. Reasons of a similar nature have led to the duplication of the atomic weight of carbon, sulphur, and many of the other elements. There must obviously be some means of distinguishing when O indicates 8 or 16 parts of oxygen, C indicates 6 or 12 parts of carbon, etc. Various modes of distinction have been adopted by different chemists. In Watts's

* In these cases, one of the new forms of nomenclature is introduced.

Dictionary of Chemistry (published between 1863 and 1868), the new atomic weights are represented by the same symbols which have hitherto been adopted for the old weights; while the latter (when they are occasionally introduced) are printed in italic capitals; thus water is represented by H_2O in the new and by *HO* in the old system, acetic acid by $C_2H_4O_2$ in the new and by $C_2H_3O_2$ in the old system, etc. A more common means of indicating when the value of the symbol of an element is doubled in value is by drawing a horizontal bar through it, a notation due to Berzelius; thus, $\bar{C}, \bar{O}, \bar{S}$ represent respectively an atom of carbon, of oxygen, and of sulphur in the new system. This system is useful in forming, as it were, a bridge to facilitate the passage from the old to the new system, and will gradually disappear when all chemists recognize the doubled atomic weights. Naquet, Miller (in the 3d edition of his *Chemistry*, 1864), and others, adopt this *barred* system, and the latter frequently gives the formulæ pertaining to both systems; for example, $FeO.SO_3.HO.6HO$, or $\bar{Fe}.\bar{S}O_3.H_2O.6H_2O$, represents the composition of the crystallized sulphate of protoxide of iron often described as protosulphate of iron.—*Inorganic Chemistry*, 3d ed., p. 6. Some writers, as Frankland, in his *Lecture Notes for Chemical Students*, 1866, following the plan of Watts and the contributors to his dictionary, unreservedly adopt the doubled atomic weights, and represent them by the old formulæ; thus O, C, and S represent in these works precisely double the weight of oxygen, carbon, and sulphur that these capitals represent in the 1st and 2d editions of Miller's *Chemistry*, Fownes's *Manual of Chemistry*, and other standard works published a few years ago. It is now customary for the writers of chemical papers who object to the barred symbols as being unseemly, to insert at the commencement C = 6, O = 8, or C = 12, O = 16, in order that the reader may be able to recognize which system is adopted.

Chemical Nomenclature is still in an unfinished state. The chemists of all countries are, with one notable exception, agreed as to the names and symbols which should represent the different elements. The French chemists persist in designating nitrogen by the name of *azote*, and of using Az instead of N for its symbol; and in Italy the term *azoto* is still employed, but as it is often coupled with the symbol N, it will probably soon be exchanged for the more general term nitrogen. When two elementary bodies unite together, they form a *binary compound*. The nomenclature of the binary compounds is in a transitional state. The compounds of sulphur with metals used to form *sulphurets*, latterly have been termed *sulphides*, and now they are denominated after a third fashion; sulphuret of potassium (for example), after having been for some years sulphide of potassium, now being termed *potassic sulphide*. In order to obtain uniformity, the following rule is adopted by the representatives of the modern school. The names of binary compounds are formed from those of their constituents, the English or Latin name of the positive constituent with the terminal *ic* preceding that of the negative constituent, which is made to end in *ide*. Thus: potassium and sulphur form potassic sulphide; sodium and oxygen form sodic oxide (formerly soda or oxide of sodium); silver and chlorine form argentic chloride (formerly chloride of silver); lead and iodine form plumbic iodide (formerly iodide of lead); calcium and chlorine form calcic chloride (formerly chloride of calcium), etc. When the same elements form two compounds, the one which contains the smallest proportion of the negative element is distinguished by changing the terminal syllable of the name of its positive constituent into *ous*, while the terminal *ic* is retained for the compound containing the larger proportion of the negative element. Thus, 1 atom of iron and 1 atom of oxygen form *ferrous oxide* (the old protoxide of iron); 2 atoms of iron and 3 atoms of oxygen form *ferric oxide* (the old peroxide of iron). Sometimes the same elements form more than two compounds with one another, and then the prefixes *hypo* and *per* are employed. When a binary compound contains oxygen, and becomes an acid when made to unite with water, or becomes a salt when united to a base, it is termed an *anhydride* (q.v.) or *anhydrous acid*. Thus 1 atom of carbon and 2 atoms of oxygen form *carbonic anhydride*, formerly known as carbonic acid gas; 1 atom of sulphur and 3 atoms of oxygen form *sulphuric anhydride*, etc. In a considerable number of cases, the trivial or common name has not been displaced by the new systematic name; thus water, ammonia, hydrochloric acid, phosphureted hydrogen, sulphureted hydrogen, etc., are not as yet replaced by hydric oxide, hydric nitride, hydric chloride, hydric phosphide, hydric sulphide, etc.; and soda and potash are still preferred by some chemists to sodic and potassic hydrates.

The term *acid* was originally applied only to substances which, like vinegar, possessed an acid taste; it is now made to include a large number of compounds which do not possess this property. The most general definition of acids is that of Gerhardt, which is adopted in Watts's *Dictionary of Chemistry*—namely, that "acids are salts of hydrogen." A more intelligible definition to ordinary readers is that which is adopted by Frankland, in which an acid is described "as a compound containing one or more atoms of hydrogen, which become displaced by a metal when the latter is presented to the compound in the form of a hydrate." Thus, using the new nomenclature and atomic weights, nitric acid and sodic hydrate, yield sodic nitrate and water—

in which reaction the hydrogen of the nitric acid is displaced by the sodium of the sodic

hydrate (or soda), and as only *one* atom of hydrogen is displaced, nitric acid is said to be *monobasic*. When an acid admits of the displacement of two atoms of hydrogen, it is termed *dibasic*—as tartaric, oxalic, and, according to recent views, sulphuric acid; and when three atoms can be replaced—as in the case of common phosphoric acid, H_3PO_4 , in which H_3 may be displaced by K_3 or Ag_3 , the acid is termed *tribasic*. The nomenclature of the compounds of acids with bases is still unfixed. The names of the alkali-metals (potassium, sodium, and lithium) and alkaline-earth metals (barium, calcium, etc.) are now commonly substituted for those of their oxides in the nomenclature of the corresponding oxygen salts—as, for example, *carbonate of sodium* and *sulphate of calcium* for carbonate of soda and sulphate of lime. The names of these bodies are thus brought into uniformity with those of the salts of iron, copper, etc. In *Watts's Dictionary* and *Frankland's Lecture Notes* such compounds are denominated *sodic carbonate*, *calcic sulphate*, *sodic nitrate*, etc., and these terms will doubtless soon be generally adopted for the metallic salts of the oxygen-acids generally. The nomenclature of complex inorganic bodies is founded, for the most part, on the theory of types, the names of particular compounds being obtained from the name of the type by prefixing to it adjectives which express the nature of the element by which the hydrogen of the type is replaced and the number of atoms of it contained in one molecule of the compound. By way of illustration, we give a simple and a complicated example:

$\text{Bi} \begin{Bmatrix} \text{Cl} \\ \text{O} \end{Bmatrix} =$ bismuthic oxychloride, while $\text{Hg}_4 \begin{Bmatrix} \text{Cl}_2 \\ \text{O}_2 \\ \text{N}_2 \end{Bmatrix} =$ tetramercuro-tetrahydric diox-

dichloro-dinitride. The nomenclature of organic compounds is founded on the same principles as that of inorganic bodies; but our limited space prevents our entering into this subject.

Chemical notation has been considerably altered by certain members of the recent chemical school; but on the whole, the modifications, since the time when the system of Berzelius was introduced into England in the third edition of Turner's *Elements of Chemistry*, are not numerous. The most important are the introduction of "general formulæ" by Gerhardt, in which letters of variable value are used as coefficients instead of numbers, and Odling's method of denoting the atomicity of polyatomic elements and radicals by means of accents placed above the symbols, which are then called dashed symbols. See TRIADS. Chemists are still at variance as to whether, when two or more atoms are represented in a compound, the figure indicating the repetition should be above or below the symbol; whether, for example, water should be represented by H^2O or H_2O , and alcohol by $\text{C}^2\text{H}^6\text{O}$ or $\text{C}_2\text{H}_6\text{O}$. The *ordinary* or *dualistic* system, according to which the elements combine in couples to form compounds, which similarly unite by twos, led to the division of salts into two classes—viz., into salts composed of an oxygen acid and an oxygen base, which were hence called oxygen salts, as NaO, SO_3 , and KO, NO_3 , which in the old notation represent sulphate of soda and nitrate of potash; and binary or haloid salts, of which chloride of sodium, NaCl , is the type, which are formed by the union of the radical in hydrogen acids with some metal. Davy considered that the former class might be made similar to the latter by regarding them as composed of a metal and a compound radical having the same electro-negative chemical relations as the radicals in the hydrogen acids. According to this view, a radical, SO_4 , not yet isolated, combines with hydrogen to form sulphuric acid, and with a metal to form sulphates, sulphuric acid being represented by H, SO_4 , and sulphate of lime by Ca, SO_4 . In like manner, nitric acid and the nitrates were supposed to contain a radical, NO_6 . Against this view Gerhardt urges that we know nothing of the proximate constitution, but are merely acquainted with the ultimate composition of compounds. Hence we now no longer use a formula for sulphuric acid indicating its supposed constitution (HO, SO_3), but regarding it as a dibasic acid, express it, either as Miller does, by $\text{H}_2\text{S}\text{O}_4$, or by H_2SO_4 (where $\text{S} = 32$ and $\text{O} = 16$), or by $\text{SO}_2 \begin{Bmatrix} \text{SO}_2 \\ \text{H}_2 \end{Bmatrix} \text{O}_2$, if we adopt the type-notation; and we must not omit that Frankland, who may be regarded as the leading representative of the English school of modern chemistry, represents it by the formula $\text{SO}_2.\text{Ho}_2$, when Ho is the abbreviated formula for HO , and represents a compound radical, to which he gives the name of hydroxyl, and which is commonly known as binoxide of hydrogen, being expressed, according to the old system, by HO_2 . The following examples may enable the reader to pass from one system to another:

	Old System.	Barred System.	New Atomic Weights.	Frankland's Notation.
Sulphate of potassium.....	KO, SO_3	K, SO_4	K_2SO_4	SO_4Ko_2
Sulphate of zinc.....	$\text{ZnO}, \text{SO}_3.7\text{HO}$	$\text{ZnSO}_4.7\text{H}_2\text{O}$	$\text{ZnSO}_4.7\text{H}_2\text{O}$	$\text{SO}_4\text{Ho}_2.\text{Zno}'' .60\text{H}$
Nitric acid.....	HO, NO_3	HNO_3	HNO_3	NO_6Ho
Nitrate of sodium.....	NaO, NO_3	NaNO_3	NaNO_3	NO_6Nao

The Ko , Zno'' , and Nao in Frankland's notation represent compound radicals, to which he has given the names potassoxyl, zincoxyl, and sodoxyl, and which are represented in the ordinary new notation by KO , ZnO_2 , and NaO . These new names will probably soon get into general use in consequence of Frankland's great influence as the teacher of chemistry in the government school of mines, and at the royal institution.*

* Another peculiarity of Frankland's notation is the introduction of thick letters (Egyptian capitals). His formulæ are so written as to denote that the element represented by the first symbol of a formula, and printed in this type, is directly united by points of attachment or *bonds* with the other elements or compound radicals following the first symbol. Thus, to use his own illustration and notation, the formula $\text{SO}_2.\text{Ho}_2$ (sulphuric acid) signifies that the hexad atom of sulphur is combined with the four bonds of the two atoms of oxygen, and also with the two bonds of the two atoms of hydroxyl. (By hexad we mean an atom with six bonds, one of which is subsequently figured in the text.)

We must refer to the article TRIADS for a description of what is meant by *atomicity*, or, as Hofmann terms it, *quantivalence*, and the reader will do well to study lectures 10 and 11 of his *Modern Chemistry*. In the article just mentioned, we have stated that the degree of atomicity of an element is indicated by the number of dashes with which it is furnished. In the so-called *graphic notation*, which, in the hands of Kekulé, Crum Brown, Naquet Frankland, and others, has proved a most valuable aid in explanation of the constitution of chemical compounds, the degree of atomicity of an atom is thus expressed :

The true meaning of atomicity or chemical valency has up to the present evaded all attempts to solve it by chemical demonstration, and as this property of matter is the link joining its physical and its chemical structure, the theory of chemistry is founded on hypothesis. The theory of valency which most fully complies with the known reactions and properties of matter is based upon the electrical behavior of its atoms. When an electric current is passed through several cells containing different electrolytes, it liberates in each of them the same number of valencies, not of atoms. Helmholtz showed that the quantity of electricity moving with each of the atoms is distributed among its valencies. Reicke from farther researches concluded that the atoms are surrounded by systems of positive and negative poles. The atom is here represented as a sphere surrounded by an envelope of ether in which the valencies are contained, the latter appearing to be determined by the presence of two opposite electric poles at the ends of a short straight line called a di-pole. In a radial position the di-pole forms an axis of rotation of the atom, but in a tangential position the rotation is annulled. This shows two kinds of simple linking. In manifold linking the rotation cannot exist. An understanding of the most important properties of chemical valency may be gathered from this hypothesis.

"No element," says Frankland, "either alone or in combination, can exist with any of its bonds disconnected; hence the molecules of all elements with an odd number of bonds are generally diatomic, and always polyatomic—i.e., they contain two or more atoms of the element united together. Thus:

An element with an even number of bonds can exist as a monatomic molecule, its own bonds satisfying each other. Thus:

This graphic notation is most useful in fixing upon the mind the true meaning of symbolic formulæ, and in elucidating the internal arrangement of the very complex molecules which often occur in both mineral and organic compounds. It also affords an easy means of showing the causes of isomerism in organic bodies. The following example will suffice to illustrate our meaning. The simplest of the alcohol family, methylic alcohol, is derived from marsh-gas by the substitution of one atom of Frankland's hydroxyl, Ho or HO (O = 16), for one of hydrogen.

The classification of organic compounds has, during the last few years, been much improved. Until a comparatively few years ago, organic compounds were arranged, according to their most obvious properties, into acids, bases, fatty bodies, etc. Now the great majority of these compounds are arranged in series, of which each group differs from the preceding one by a fixed additional number of certain atoms. Thus (see Armstrong's *Organic Chemistry*, pp. 143, 144) twelve alcohols are represented by the general formula $C_nH_{2n+2}O$ (new notation), the first being represented by CH_4O , and the others differing from it by an additional number of multiples of CH_2 . Bodies of analogous properties thus united are termed *homologous*. Again, every compound in a homologous series yields other compounds differing in composition from that from which they are derived, but yet bearing a different relation to it. Thus, alcohol yields ether, aldehyde, and acetic acid, and these so-called *heterologous* bodies form collateral series. This mode of classification is daily extending. It includes the *organic radicals*, such as methyl, ethyl, allyl, phenyl, cyanogen, etc.; the *hydrides of the compound radicals*, such as methylic hydride or marsh-gas, benzol, cyanic hydride or hydrocyanic acid, etc.; the *alcohols*, which form one of the most important of the families of organic compounds, and which are considered in a special article in this CYCLOPÆDIA; the *aldehydes* and *ethers*, both of which are specially described; the *acids*, of which the monobasic acids alone include six series, amongst which are the acetic or fatty series, represented by the general formula $C_nH_{2n}O_2$, and containing over 20 distinct acids, the oleic series, the lactic series, the benzoic or aromatic series, etc.—while the dibasic acids may be divided into four series, in which occur the succinic series, containing nine acids, most of which present several modifications, and the tartaric series; the *anhydrides* (q.v.), of which those belonging to the acetic acid group may be arranged in series; the *ketones* or *acetones*; the compounds of nitrogen containing the *amines*, *amides*, *imides*, etc.; and, in short, excepting the natural alkaloids, the protein-compounds and their derivatives, the uric acid group, pigments, etc., there are few organic compounds which will not soon find a definite place in a series.

In this article we have strictly confined our remarks to the subjects bearing on general, and for the most part on theoretical chemistry. We may, however, allude, in conclusion, to two subjects, which have undergone a great development during the last few years—viz., *volumetric analysis* and the *synthesis of organic bodies*, both of which are discussed in special articles.

The general tenor of this article shows that chemistry is at present in altogether a transitional state. As Prof. Anderson of Glasgow observes in his address to the chemical section of the British Association in Sept., 1867, the atomic theory, which, at the commencement of the present century, sufficed to explain all the facts of chemistry that were then known, is now quite inadequate to that end. At that time, chemists were acquainted with comparatively few compounds, and in these, oxygen was of such preponderating importance, that the science might have been almost termed “the chemistry of oxygen.” Oxygen is now deposed from its high place, and is supplanted by carbon to such a degree, that one of the first living chemists has actually proposed for organic chemistry the name of “the science of the carbon compounds.” Facts gradually accumulated in the course of time which did not admit of explanation on the Daltonian theory; and as their number increased, such terms as catalysis, allotropy, etc., were invented, under which such facts were grouped together as were supposed to depend on similar causes. Such grouping may have certain temporary advantages, provided it is understood that, to use Prof. Anderson's words, it is “the grouping of ignorance.”

It is indeed obvious that a true theory of chemistry must be a part of a general theory of dynamics, and that until we obtain some more distinct idea of how the atoms are grouped in the molecules of substances (see ATOMIC THEORY) than we at present possess, the link connecting theoretical chemistry and theoretical dynamics is wanting. The doctrine of *atomicity* evidently points to some general truth; it has been of great use in grouping together numerous facts, and in leading to investigations which have resulted in the discovery of many new facts and new generalizations, but we now want an explanation of this doctrine, and this chemistry does not appear to be able to give us. The want of a theoretical explanation does not, however, render a generalization valueless, and much progress has been made of late years in ascertaining the “chemical structure” of substances—that is, in obtaining graphic formulæ, which consistently represent all the reactions by which the substances are formed or transformed. Before discussing the subject of chemical structure, it will be well to consider somewhat more fully than has been done above, the reasons why certain numbers have been selected for the atomic weights of the elements rather than any multiples or submultiples of them (see ATOMIC WEIGHTS). It was pointed out by Dulong and Petit that a close relation exists between the specific heat of a solid elementary substance and its atomic weight. Thus, if we take the old system of *atomic weights* (q.v.), and multiply the specific heat of each solid element by its atomic weight, we find that the elements form three groups. In the first, the product of specific heat into atomic weight, or *atomic heat*, varies from 6 to 6.6. In the second it varies from 3 to 3.3. In the third group, containing the allied elements, carbon, boron, and silicon, no regularity can be traced. By far the greater number of solid elements belong to the first or second group. Now it is plain that the atomic heat of a member of the first group is approximately double that of a member of the second

group. But as the atomic weights are to a certain extent arbitrary, we can make the atomic heats of the two groups agree by doubling the atomic weights of the members of the second group. This was first proposed by the eminent Italian chemist, Cannizzaro, and has now been accepted by most chemists. These new atomic weights not only greatly simplify Dulong and Petit's law, but are also in harmony with many other facts, most of which were observed after the change had been made. Thus the formulæ of corrosive sublimate, bichloride of tin, and zinc methyl are, according to the old system, HgCl_2 ; SnCl_2 ; and ZnC_2H_3 ; and $\text{H} = 1$. According to the new system, they are HgCl_2 ; SnCl_4 ; and $\text{Zn}(\text{CH}_3)_2$.

It will be at once observed that the second set of formulæ represent just twice the quantity represented by the first; now the second formulæ express the *molecular weights* of the substances according to Avogadro's law (see ATOMIC THEORY). Further, if we adopt the old atomic weights, we see no reason why oxide of lead should readily form basic salts, while oxide of silver does not. This peculiarity is to some extent explained by the new atomic weights; thus we have nitrate of silver—old formula AgNO_3 , new formula AgNO_3 ; nitrate of lead—old formula PbNO_3 , new formula $\text{Pb}(\text{NO}_3)_2$; basic nitrate of lead—old formula $\text{PbO}, \text{PbNO}_3$, new formula $\text{Pb}_2\text{O}(\text{NO}_3)_2$. The contrast will be better seen if we put the new formulæ into a graphic form.

We at once see the connection between the dyad character of lead ($-\text{Pb}-$), and the occurrence of basic salts.

Similarly let us notice the effect of treating potassium oxide and calcium oxide with equal quantities of hydrochloric acid. The result in one case is two molecules of potassium chloride and one molecule of water; while in the other, it is one molecule of calcium chloride and one molecule of water. Putting the symbols in graphic form we have:

Where we see why we have, in the first case, two molecules of potassium chloride, and in the second, one molecule of calcium chloride, the reason being that calcium is a dyad, and one atom of it has the combining capacity of two atoms of potassium. Many other examples might be given, but these may suffice as an indication of the reasons which have induced chemists to prefer the atomic weights given in the second column in the table in the article ATOMIC WEIGHTS.

Assuming, then, these atomic weights, let us return to the subject of *Chemical Structure*. This may be defined in various ways, but most conveniently as the indication by a graphic formula, or something equivalent to it, of all the chemical changes by which the substance can be formed or decomposed. This will best be illustrated by means of a few examples, and we shall select these from among organic compounds, that is, compounds of carbon, because the structure of these compounds has been most fully investigated.

Acetic acid has (on the new system, which will be exclusively used in the remainder of this article) the formula $\text{C}_2\text{H}_4\text{O}_2$. If it is treated with caustic potash, it yields acetate of potash according to the equation $\text{C}_2\text{H}_4\text{O}_2 + \text{KHO} = \text{C}_2\text{H}_3\text{KO}_2 + \text{H}_2\text{O}$. Here one atom of hydrogen has been replaced by one atom of potassium, and we find that further treatment with caustic potash does not cause any further replacement of hydrogen by potassium. We may therefore write the formula of acetic acid thus: $\text{H}(\text{C}_2\text{H}_3\text{O}_2)$, and this formula indicates the replaceability of one atom of hydrogen by metal, and explains (as far as such formulæ can explain anything) the occurrence of such compounds as acetate of lead $(\text{C}_2\text{H}_3\text{O}_2)\text{-Pb}(\text{C}_2\text{H}_3\text{O}_2)$, and all the other acetates. The question now remains, what is the structure of the group $\text{C}_2\text{H}_3\text{O}_2$, which is united in acetic acid to hydrogen, and in the acetates to metal?

To answer it we must examine some other reactions of acetic acid. When treated with pentachloride of phosphorus, it loses an atom of oxygen, the place of which is taken by two atoms of chlorine—the pentachloride of phosphorus taking the oxygen in exchange for the chlorine; but instead of obtaining a compound $(\text{C}_2\text{H}_4\text{OCl}_2)$, we find that the result is expressed by the equation: $\text{C}_2\text{H}_4\text{O}_2 + \text{PCl}_5 = \text{C}_2\text{H}_3\text{OCl} + \text{HCl} + \text{POCl}_3$. We thence conclude that in acetic acid the atom of dyad oxygen removed in the action

given above was united to an atom of hydrogen, and to the group C_2H_3O , and represent the change thus:

the replacement of the dyad oxygen by two atoms of the monad chlorine necessitating the falling asunder of the compound. The reactions of chloride of acetyl (C_2H_3OCl) lead us to the further conclusion that the atom of hydrogen replaceable by metal is the atom not present in chloride of acetyl, so that the formula $(C_2H_3O)-O-H$ is a fuller and more explanatory form of $(C_2H_3O_2)-H$. Again, if we heat acetate of potash with caustic potash, we have marsh gas (CH_4) given off, and the residue consists of carbonate of potash.

and this decomposition can only be represented if we give acetic acid the formula

the dotted lines separating in the diagram the symbols of the parts of the molecules which change places.

We have considered only a few of the reactions of acetic acid, but the formula just given is equally consistent with all the others. It is therefore said to exhibit the *structure* of acetic acid. This word "structure" is perhaps a little misleading—we must recollect the precise sense in which it is used, as a concise representation of many reactions. It is conceivable that it may have some relation to the actual relative position of the atoms in a molecule of acetic acid, but we have not as yet any means of ascertaining whether this is so or not.

We may illustrate the meaning of chemical structure further by a somewhat more complex case. Asparagine, a colorless crystalline substance extracted from asparagus, and also from the blanched shoots of other plants, has the composition expressed by the formula $C_4H_5N_2O_3$. When treated with caustic potash it yields ammonia and a body called aspartate of potash—the potash salt of aspartic acid. The change is obviously

an exchange of $K-O-$ and $-N \begin{Bmatrix} H \\ H \end{Bmatrix}$ and may be thus indicated:

Aspartic acid is then $(C_4H_5NO_3)-O-H$, and we have to study its decompositions in order to discover the structure of the group $(C_4H_5NO_3)$. Now, aspartic acid is attacked by nitrous acid, and the products are nitrogen gas, water, and malic acid, thus: $C_4H_5NO_4 + HNO_2 = C_4H_5O_5 + N_2 + H_2O$. Here we have the triad nitrogen of the aspartic acid replaced by the dyad O, and the monad group $-O-H$ of the nitrous acid,

and this leads to the formula $\begin{Bmatrix} H \\ H \end{Bmatrix} N-(C_4H_5O_3)-O-H$ for aspartic acid. The equation

above thus becomes:

When malic acid is treated with hydrobromic acid, we obtain water and bromo-succinic acid:

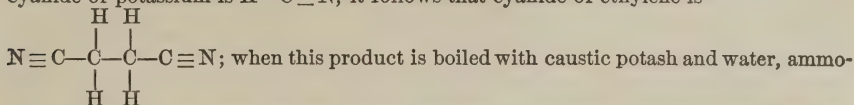

and we can prove that the group $\text{H}-\text{O}-$, here replaced by Br, is that one which in aspartic acid is represented by $\text{H} \left\{ \begin{array}{c} \text{H} \\ \text{N}- \end{array} \right.$. Bromo succinic acid, when treated with nascent hydrogen, has its bromine removed and hydrogen put in its place, thus yielding succinic acid ($\text{C}_4\text{H}_6\text{O}_4$). We shall most easily arrive at the structure of succinic acid by studying its synthesis.

Olefant gas (C_2H_4) unites with bromine to form a liquid having the composition ($\text{C}_2\text{H}_4\text{Br}_2$), and (as can easily be proved by its relation to glycol and glycollic acid), a structure represented thus:

This bromide of ethylene, as it is called, when treated with cyanide of potassium, gives bromide of potassium, and a substance which may be called cyanide of ethylene—bromine and cyanogen changing places ($\text{C}_2\text{H}_4\text{Br}_2 + 2\text{KCN} = \text{C}_2\text{H}_4(\text{CN})_2 + 2\text{KBr}$). As cyanide of potassium is $\text{K}-\text{C}\equiv\text{N}$, it follows that cyanide of ethylene is

Here are obviously two hydrogen atoms having a different function from the rest—those, namely, which are replaceable by metal, and which, in the above formula, are represented as directly united to oxygen. That it is not one of these that is replaced by bromine follows from the fact that bromo-succinic acid has also two atoms of hydrogen replaceable by metals in exactly the same way as in succinic acid itself, and as the other four atoms of hydrogen do not differ in position in the diagram from one another, we have only one possible formula for bromo-succinic acid; and therefore, for malic acid:

and for aspartic acid:

We have, however, two possible structural formulæ for asparagine, as it is plain that the two groups $\text{H}\cdot\text{O}-$ in aspartic acid are not similar to one another, and we have not as yet any means of deciding between them. The reader will see that they are different, and from the way in which structure has been proved, will also see that reactions may be obtained which would decide between the two.

It is not necessary to give any further examples of chemical structure—the two we have treated in some detail may suffice to show how the principle is applied, and what is the nature of the evidence in favor of particular structural formulæ.

Great advances have been made in the science of chemistry by the discoveries of new methods of research, among which the spectroscope has been perhaps the most important. The extreme delicacy of this method of analysis is shown by the fact that the presence of particular elements can be detected with certainty, even in quantities

of less than a millionth of a grain; an amount impossible to detect by ordinary analytical methods. The value of spectrum analysis has been shown also by the detection of several new elementary bodies by its use, and from the fact that in a compound substance it is easy to detect the presence of each ingredient. Discoveries in regard to the nature of solutions have shown that the same vapor pressure, the same freezing point, and the same osmotic pressure are common to solutions of different substances in the same liquid, which contain in the same volume an equal number of molecules of the dissolved substance. This offers the possibility of determining the true molecular weight of substances by experimenting with them in solution instead of, as formerly, only in the gaseous state. Another condition under which attempts have been made to examine substances is near the zero of temperature. This zero is defined as that temperature at which gas molecules exert no pressure, and is fixed by certain reasons at -274°C . Some highly interesting experiments in this direction have been made by Professor Dewar in the physical laboratory of the Royal Institution of Great Britain. The possibility of converting a gas into the liquid state depends upon cooling it below its critical temperature, above which no pressure can force it into a liquid condition. Hydrogen has a critical point of about -240° and nitrogen about -200° . By using a mixture of hydrogen and ten per cent. of nitrogen Professor Dewar has succeeded in obtaining the lowest temperatures ever reached in laboratory experiments, and has obtained an undetermined liquid not improbably liquid hydrogen. By means of the expansion of liquid air the properties of bodies may be studied at very low temperatures. It was found that the tensile strength of iron at -400°F . was double what it is at 60°F . above zero. Faraday predicted that the magnetism of a permanent magnet would be increased at low temperatures, and Dewar has verified this by showing that at the temperatures made possible by the use of liquid air the magnetism of a permanent magnet was increased about 50 per cent. It was also shown that the colors of bodies are considerably changed at low temperatures, returning gradually to their original colors as the temperature rises. The attainment of the absolute zero seems to be an impossibility in laboratory experiments, but the study of matter at the abnormally low temperatures thus produced offer a means of verifying conclusions drawn from other methods of research.

Lord Rayleigh and Professor Ramsay announced last year the discovery of a new element in the atmosphere. They were led to such an investigation from observing that the density of nitrogen appeared to vary considerably under different circumstances. By passing an electric spark through air with an excess of oxygen the density of the nitrogen increased to 19.8. Nitrogen was also passed through tubes containing heated magnesium, converting the nitrogen into a nitride, and a residual gas of a density of about 20.8 remained. This was characterized by extreme inertness, and on examination by Professor Crookes its spectrum was found to differ from any other known element. Professor Dewar, in liquefying air, has also observed that a white solid remains after all traces of impurities have been removed from the air, which may possibly coincide with the inert gas found by Lord Rayleigh. There is considerable doubt, however, as to the elementary character of this gas, as well as to the amount in which it exists in the atmosphere. Lord Rayleigh found it in the proportion of about 1 per cent, while the substance noticed by Dewar formed a smaller percentage.

Until the nature of this gas is determined by farther research, there are some reasons for doubt as to its being an element rather than an allotropic form of nitrogen. Considered as the latter, the experimental results obtained can be easily explained. The theoretical density of allotropic nitrogen would be 21, which is very near the value found from the experiments. The inertness of the new gas would be inferred as a characteristic of allotropic nitrogen from analogy to the allotropic form of phosphorus, its nearest allied element. Phosphorus, when heated for some hours at 240°C . in an atmosphere which does not act upon it chemically, is reduced to an allotropic form of a red color, which is compared to yellow phosphorus relatively inert. Nitrogen, being so inert in its common form, would therefore by analogy be extremely inert in its condensed form. If the new gas proves to be a triatomic form of nitrogen, the extent, if any, of its normal presence in air remains to be shown, as this substance may be manufactured rather than separated during the experiment of analysis. Its appearance in such minute quantities favors this view, as if it is produced by electric discharges, its inertness would tend to its accumulation in large amounts. Assuming this new gas to be in reality an element, the name *Argon* (Gr. ἀργον, "inert") has been given to it. Its symbol is A.

CHEMISTS AND DRUGGISTS, LAWS RELATING TO. In the United States the terms apothecaries, druggists, pharmacists, and sometimes chemists, are used with little or no distinction as names of those licensed to compound and sell drugs and medicines upon prescriptions of physicians or otherwise; in Great Britain, however, a legal distinction exists between the three classes—apothecaries, chemists and druggists, and pharmaceutical chemists; the law of 1868, designed specially to restrict the sale of poisons, made the classification just referred to for the sake of public convenience. Under this law apothecaries form practically a lower branch of the medical profession, having the right to practice in certain classes of cases; chemists and druggists are those who have passed an examination at the Pharmacy college and have received a license to sell and compound drugs and poisons; pharmaceutical chemists are those who have passed a second "major"—as it is called—examination, and who constitute a higher branch of the profession. Laws relating to the business of selling and compounding drugs and medicines, under whatever name the

business is carried on and whether in the United States or in England, are either limiting and defining the qualifications of those who may carry on the business, or restricting the sale of poisons or intoxicating liquors, or defining the liability for injuries caused by carelessness or ignorance. Generally speaking, the statutes of the states in this country require a person wishing to adopt the profession of druggist, either to pass an examination before a board appointed for that purpose or to produce a diploma from a college of pharmacy recognized as having authority and weight. Either state or city ordinances prescribe the conditions under which poisons may be sold, directing, for instance, that certain kinds of labels be used on bottles containing the poisons and that the names of persons purchasing be entered in a book open for public inspection. Druggists are sometimes also forbidden to sell certain drugs or liquors except on physicians' certificates. Gross carelessness on the part of a druggist in compounding a prescription, if it leads to death or serious injury, is a penal offense; if death ensue, the offense usually amounts to manslaughter.

CHEMITYPE is the name given by its inventor, C. Pül, a Dane, to the art of producing on a metal plate, by a chemical process, an engraving in relief. The outline of the process is this: On a polished plate of zinc an etching or an engraving is made in the usual way. The depressions of this design are then filled up with a melted metal—the nature of which is not revealed—and this superadded metal is then reduced to the exact level of the zinc, so that the design now appears as if inlaid. An acid is next applied to the surface, which attacks the zinc, without affecting the inlaid metal; and thus there results an exact copy in relief of the original intaglio engraving. In competition with wood-cuts, relief-lithographs, and copperplates, C. does not seem as yet to evince any great superiority; it fails especially in that character of strength and softness which wood-cuts express so well. The prints produced by this art look more like engravings than like wood-cuts. They have this advantage, however, that they give an exact copy of the original design made by the artists on the metal; whereas in wood-cutting the drawing made on the block may be impaired in its effect by the engraver. C. is particularly adapted for producing maps by the common printing-press. Pül practiced his invention at first on a small scale in Copenhagen, from 1843 to 1846, and then extensively in Leipsic. In 1850, he went to Vienna, where he was employed in the imperial printing establishment.

CHEMNITZ, a t. of Saxony, is situated at the base of the Erzgebirge, and at the confluence of the river Chemnitz with three other rivers, in lat. 50° 50' n., and long. 17° 55' east. It is the principal manufacturing town of Saxony—its industry consisting in weaving cottons, woollens, and silks, and in printing calicoes, chiefly for German consumption. Cotton stockings are a most extensive manufacture, and rival the British in quality and cheapness. They are exported extensively to the United States. It has several extensive machine factories, producing machinery for flax and wool spinning, weaving, and mining industry. Amongst the numerous educational institutes of C. are schools of weaving, mining, and tailoring. For four centuries C. was a free imperial city. Traces of its antiquity are seen in many of the buildings. Pop. '95, 160,991.

CHEMNITZ, MARTIN, next to Luther and Melancthon the most distinguished German Protestant theologian of the 16th c., was b. at Treuenbrietzen, in Brandenburg, 9th Nov., 1522; studied at Frankfort and Wittenberg; and, in 1548, became rector of the cathedral-school of Königsberg. About 1550, he began to devote himself seriously to theology, and in 1553 went back to Wittenberg, where he delivered prelections on Melancthon's *Loci Communes*, from which sprang his own *Loci Theologici*, which, for method and learning, excels all similar books of the same age. In 1554, he was made a preacher in Brunswick, where he wrote his *Repetitio Sanae Doctrinae de Vera Presentia Corporis et Sanguinis Domini in Cena Sacra* (Leip. 1561), in which he defended Luther's view of the Lord's Supper against that of the Swiss reformers; the *Theologia Jesuitorum Præcipua Capita* (Leip. 1562); and the *Examen Concilii Tridentini* (Leip. 1565), a work in which he has argued with remarkable acuteness and learning against the dogmas of the church of Rome. His *Corpus Doctrinae Prutenica* (1566), written in conjunction with Mörlin, became a standard work of divinity among the Prussian Protestants. But his greatest ecclesiastical achievement was inducing the Saxon and Swabian churches to adopt as their confession of faith the *Concordienformel*, and thus extending and consolidating the creed of Luther. He died at Brunswick, 8th April, 1586.

CHEMNITZIA, a genus of gasteropodous mollusca. It has a slender, elongated, many-whorled shell; the whorls striated; a simple semi-oval aperture; and a horny operculum. There are many recent species scattered all over the world. The discriminating characters of the fossil species being taken from the form of the shell, it is more than probable that the remains of very different animals are classed under this generic name. No less than 180 species have been described, occurring throughout all the divisions of the fossiliferous strata from the lower Silurian upwards.

CHEMOSH, the national deity of the Moabites and the Amorites. Solomon introduced the worship of C. into Jerusalem, but Josiah put a stop to it. Scholars are not agreed as to descriptions either of the deity or the worship. Jerome identifies C. with Baal-Peor; others with Baal-Zebub; Genesius with Mars, or some god of war; some

with Saturn, as the star of ill-omen; C. having, according to Jewish legend, been worshipped in the form of a black stone; and Maimonides says his worshipers went bareheaded, and used no garments sewn by the needle.

CHEMUNG a co. in s. New York, on the Pennsylvania border, and traversed by the Erie, the Lehigh Valley, the Delaware, Lackawanna, and Western, and the Northern Central railroads. The area is 436 square miles; the population, '90, 48,265. The surface is partly level and partly hilly; soil fertile. The chief productions are wheat, corn, oats, buckwheat, potatoes, hay, butter, wool, honey, and tobacco. There are in the county several carriage and wagon manufactories, flour-mills, saw-mills, tanneries, etc. Co. seat, Elmira.

CHEMUNG PERIOD is the name given by American geologists to one of the principal divisions of Devonian (q. v.) time.

CHENAB, the largest, according to general opinion, of the five rivers which give name to the Punjab.

CHENANGO, a co. in s. New York, on a branch of the Susquehanna and the Chenango and Unadilla rivers, and the New York, Ontario, and Western, and the Delaware, Lackawanna and Western railroads; 854 sq. m.; pop. '90, 37,776. It has an elevated, hilly, and broken surface, with fruitful soil, producing corn, wheat, oats, potatoes, hay, cheese, butter, wool, maple sugar, and hops. There are in the county more than 40 cheese factories, and several flour mills, tanneries, furniture, and carriage manufactories. Co. seat, Norwich.

CHENANGO RIVER, a stream in central New York, rising in Oneida co., and flowing with a length of about 90 m., through Madison and Chenango counties to the Susquehanna, near the Pennsylvania boundary.

CHENERY, THOMAS, 1826-1884; b. in Barbadoes; educated at Eton and Cambridge; prof. of Arabic at Oxford, 1868-69; was appointed one of the revisers of the Old Testament, 1870; honorary sec. to Royal Asiatic soc. C. was one of the most thorough Arabic scholars in England, and will be remembered chiefly by his translation of *The Assemblies of Al Harui* and his edition of *Machberoth Ithiel*, 1872. He was the successor of Mr. Delane as editor of the London *Times*, 1877.

CHENEY, CHARLES EDWARD, D.D.; b. 1836; a graduate of Hobart college, and a student in the Virginia theological seminary (Episcopal). He had pastoral charge in Rochester and Havana, N. Y., and in Chicago, Ill. In Dec., 1873, having left the Protestant Episcopal church, he was chosen assistant bishop, and afterwards bishop, of the Reformed Episcopal church, then newly organized. He is a vigorous thinker and an able organizer; he is still rector of Christ church, Chicago.

CHENEY, JOHN VANCE, librarian, b. Groveland, N. Y., 1848; practiced law in New York; became librarian of the public library at San Francisco, 1887, and of the Newberry library at Chicago, 1894; published several poems, including *Thistle Drift* (1887) and *Wood Blooms* (1888).

CHENEY, SETH, 1810-1856; b. Conn.; famous as artist of female heads in crayon. To him is attributed the initial movement of crayon work in this country. His wife, Ednah Dow, b. 1824, is a well-known author.

CHÉNIER, ANDRÉ-MARIE DE, 1762-94; a French poet, b. in Constantinople. He undertook military life, but resigned his commission after six months' trial, and returned to Paris, where he wrote idyllic poems, such as *Le Mendicant*; *L'Aveugle*; and *Le Jeune Malade*. Overwork made a journey for health necessary, and he traveled in Switzerland, Italy, and the Grecian islands. Returning to Paris in 1786, he recommenced study and work, and produced the *Elegies*; *Art d'Aimer*; *L'Invention*; *Hermès*; *Susanne*, and *La Liberté*. From 1787 to 1790, he resided in London as a secretary to the French embassy, but neither the position nor the people were congenial, and he returned to France, plunging at once into the revolution, then well under way, taking the moderate side. In 1791, he was defeated as a candidate for a seat in the national assembly, and the next year an invective against the Jacobins involved him in a quarrel with his brother Joseph, whom he was afterwards to defend against the attack of Burke. When the hopes of the monarchy were gone, he returned to literature, but the trial of the king brought him once more forward, and he took part in preparing the defense, and also drew up an appeal to the people. He was broken in health and spirits; Paris was dangerous; and he went to Versailles, where he wrote poems to "Fanny." At Passy, Jan. 6, 1794, he opposed the arrest of a lady in whose house he was living, an act which resulted in his own seizure and incarceration in St. Lazare. Here he wrote *La Jeune Captive* for the duchess of Fleury, and for the convention the furious iambics so often quoted. At the tribunal he appeared with 44 others, and 38, including himself, were condemned to execution. The next day, July 25, 1794, he, with the counts de Montalembert and de Cregui, was led to death. As he descended the steps of the conciergerie, he said to Roucher, "Je n'ai rien fait pour la postérité. Pourtant" (striking his forehead), "j'avais quelque chose là." Three days later, in the same place, Robespierre and his fellows were executed, and the "reign of terror" was at an end. C.'s poems, with the exception of two, remained unedited for a quarter of a century.

CHÉNIER, MARIE JOSEPH DE, 1764-1811; poet and dramatist, younger brother of André Chénier; b. in Constantinople, and educated at the Collège de Navarre. He also served a short time in the army, but left it for literary composition, producing, at the age

of 20, *Azemire*, a tragedy which was not very successful. His next work, however, *Charles XII.*, gave occasion for the commencement of Talma's renown, and gained great popularity. It still keeps the stage. Following these came *Henry VIII.* and *Calas*; in 1792, *Caius Gracchus*, which was proscribed and burned because of the anti-anarchical phrase "The law, and not blood;" and the drama *Timoleon*, proscribed in 1793. The death of his brother on the scaffold took him away from play-writing, which he attempted again only once (in 1804), when he produced *Cyrus*, which was not a success. He was long a prominent member of the Jacobin club; a member of the convention, and also of the council of five hundred, over both of which he presided; he had a seat in the tribunate, and belonged to the committees of public instruction, of general security, and of public safety. In 1806-7, he delivered a course of lectures, on the language and literature of France from the earliest period; and in 1808, at Napoleon's request, he prepared his *Tableau Historique de l'Etat et du Progres de la Litterature Française*. He was the author of many hymns, songs, and odes, among them the famous *Chant du Depart*; odes on the death of Mirabeau, the oligarchy of Robespierre, etc.; tragedies that never reached the stage, and translations from the Greek, Latin, and German authors. As a satirist he was said to possess great merit.

CHENILLE (Fr., "hairy caterpillar"), a thick, velvety, tufted cord of silk, wool, or worsted, having short fibres or threads standing out at right angles from a central core of thread, or wire (and so bearing some resemblance to a woolly caterpillar). It is used in trimming and bordering dresses, in ornamental sewing, and in manufactured trimmings. In certain kinds of carpet chenille is used instead of yarn to form the weft. In embroidery, also, chenille is employed, being either laid on the surface of the stuff or drawn through with a needle. Chenille is used also in combination with wool or cotton in the manufacture of a cloth, known as *chenille cloth*.

CHENONCEAUX, CASTLE OF. See BLÉRÉ.

CHENOPODIA'CEE, or **SALSOLA'CEE**, a natural order of exogenous plants, consisting of herbaceous and half-shrubby plants, with leaves entire or divided, and destitute of stipules. The flowers are inconspicuous, hermaphrodite, or unisexual; the perianth deeply divided, persistent; the stamens inserted into its base, opposite to its segments, and equal to them in number, or fewer; the ovary single, free, or occasionally adhering to the tube of the perianth, with a single ovule attached to the base of the cavity; the style generally with 2 to 4 divisions. The fruit is membranous, inclosed in the perianth, which sometimes becomes fleshy. The seed has a curved or spiral embryo.—There are about 360 known species, most of which have a weed-like appearance, and grow in waste places. They are widely diffused over the world, but are particularly abundant in the northern parts of Europe and Asia. Beet and spinage are among the best known and most useful plants of the order. Many are occasionally used as pot-herbs, as some species of *chenopodium* and of orache. The fruit of strawberry blite (*blitum capitatum* and *B. virgatum*), a common weed in the s. of Europe, has some resemblance in appearance to a strawberry, from the coherence of the fleshy perianths of a whole spike or head of flowers, and a sweetish, insipid taste. The seed of quinoa (q.v.) is used for food as a kind of grain. Some of the C. are aromatic (see **CHENOPODIUM**). Some inhabit salt-marshes, and abound in soda, as the saltworts (q.v.).

CHENOPODIUM, a genus of plants of the natural order *chenopodiaceæ*, of which some of the native British species are well known by the name of GOOSEFOOT, as weeds growing in gardens, on heaps of rubbish, and in waste places. The species are mostly annuals, with entire or toothed leaves, which in some of them have a sort of mealy hoariness. They are mostly natives of Europe, and of the temperate parts of Asia; but some are natives of America, into which, however, some of the common European species have found their way, and are naturalized as weeds. The genus has hermaphrodite flowers, with perianth of five small green scales, five stamens, and solitary flat seeds. The leaves of many species are used as a substitute for spinage, particularly those of the GOOD HENRY, WILD SPINAGE, or ENGLISH MERCURY (*C. bonus Henrius*), a perennial plant, native of Britain and other parts of Europe, often found growing by waysides, with stem more than a foot high, powdered with minute transparent globules, and large, alternate, triangular, arrow-shaped, entire leaves. It is cultivated in some places, particularly in Lincolnshire, chiefly for the leaves, but the young shoots are also used as asparagus. *C. intermedium*, *C. album*, etc., annuals, common in waste places, are also excellent substitutes for spinage. *C. olidum* or *vulvaria* (STINKING GOOSEFOOT), an annual with an extremely nauseous odor, growing in waste places in Britain, etc., especially near the sea, is a popular medicine, in much repute as an antispasmodic and emmenagogue. *C. botrys*, a native of the s. of Europe, with pinnatifid leaves resembling those of the oak, and hence called JERUSALEM OAK, is in use as an expectorant and anthelmintic. It is not fetid like the species last named, but agreeably fragrant. *C. ambrosioides* has a strong aromatic odor, is used in Mexico instead of tea, and is much cultivated in France, an infusion of it being deemed useful in nervous disorders. *C. anthelminticum*, the WORMSEED of the United States, has a strong and somewhat aromatic odor, and a high reputation as a vermifuge. Its seeds are chiefly used, or the essential oil extracted from them, called *oil of wormseed*. More important than any of these species, as affording a principal article of food in the countries of which it is a native, is quinoa (q.v.).

CHEOPS, according to Herodotus, an Egyptian king, called Chombes by Diodorus, Souphis by Manetho, Saophis by Eratosthenes, and in Egyptian "Khufu." He was the second king of the fourth dynasty of Manetho, and the builder of the great pyramid at Ghizeh. His name was supposed to mean "wealthy," or "having much hair." He spent enormous sums on the pyramid (see PYRAMID), and one improbable story is that he was compelled through want of money to sacrifice the honor of his daughter to insure its completion. He is also depicted as impious towards the gods, closing the temples, and stopping the worship; but subsequently repenting, and writing a sacred book much esteemed by the Egyptians. The monumental information about C. does not confirm the Greek historians; on the contrary, it records the construction of temples in honor of the gods, the repair of the shrine, and the gift of various figures to the temple of Isis and Athor, close to his own pyramid, and his construction or repair of the temple of the same goddess Athor, the Egyptian Venus, at Denderah, or Tentyris. C. carried on war at the valley Magarah, in the peninsula of Sinai in Arabia; and a rock tablet represents him as having conquered the hostile tribes in the presence of the god Thoth, who had revealed to him the mines of the locality. His oppression had so afflicted Egypt, that charges of impiety had attached to his name; but the tombs of his children reveal no change in the established religion, and his pyramid differs from those of his predecessors and immediate successor only by its larger size and greater beauty. The date of C., according to Lepsius, is 3,095 to 3,032 B.C.; but great difference of opinion, amounting to nearly 2,000 years, exists as to the time of Menes, from whom the lists separate him by an interval of 898 years.

CHEPHREN, in the hieroglyphs "Khafr," called also Cephren, Chabrias, Souphis II., and Saophis II.; according to the legends, the son or brother of the Egyptian king Cheops. He built the second of the great pyramids at Ghizeh, near the sphynx and the great pyramid, and was said to have been tyrannical and hated, like his brother, so that his mummy was not buried in the sepulcher, but torn to pieces, and the sarcophagus emptied of its contents; but there is no more reason for believing in his impiety than in that of Cheops. His wife was a priestess of the god Thoth, and another prince of the family was a priest at Hermopolis. He also built the small temple behind the sphynx. It is probable that he lived 95 years, and his reign, according to Lepsius, was 3,032 to 2,966 B.C. A statue of him is in the Boulaq museum.

CHEPSTOW, a river-port in the s.e. of Monmouthshire, on the right bank of the Wye, $2\frac{1}{2}$ m. from its junction with the estuary of the Severn, and $14\frac{1}{2}$ m. e.n.e. of Newport. It lies between bold cliffs, on a slope rising from the river, in the midst of beautiful and grand scenery.

CHEQUE. See CHECK.

CHEQUE BANK, a bank founded in London, in 1873, with the Rt. Hon. John Bright and the late Samuel Morley as trustees. Under a unique and exceptionally safe system devised by a Mr. Herz, it was especially designed to place in the hands of travelers and the public generally, cheques that would be available as ready cash in any part of the world. The procedure is as follows: The customer deposits what money he desires, and receives a book containing cheques to the value of the deposit, each cheque being numbered, printed, and perforated with the value, and is of no worth until the cheque is signed by the customer, who is provided with a special letter of identification, and is required to produce the same on application. See CREDIT, LETTER OF.

CHER, a tributary on the left side of the river Loire, rising near Crocq, in the department of Creuse; flows first n. by Auzances, Evaux, Montluç, and St. Amand; then n.w. through the department of C. by Vierzon; then westward by Selles, Mont-richard, and Bléré, to the Loire, which it joins below Tours. Its whole length is about 200 m.; and it is navigable for the last 47 of its course.—CHER, the central department of France, to which the above river gives its name, is situated in lat. $46^{\circ} 25'$ to $47^{\circ} 39'$ n., and in long. $1^{\circ} 55'$ to $3^{\circ} 10'$ east. The surface is mostly level, traversed by well-wooded elevations, and produces corn, fruits, wine, hemp, flax, etc. The climate is mild and pleasant. Agriculture and pasturage of cattle are both capable of improvement. Area, upwards of 2700 sq. miles. Pop. '96, 347,725. C. is divided into the three arrondissements—Bourges, St. Amand, and Sancerre. Bourges is the chief town.

CHERASCO, a t. in the province of Cuneo, n. Italy, situated on the Tanaro, 30 m. s.e. of Turin. It has manufactures of silk, and a pop. of about 9000. A peace was concluded here between Louis XIII. of France, and the duke of Savoy in 1631. On April 26, 1796, the place was taken by the French; and here, three days after, the "Armistice of Cherasco" was concluded between the Sardinian commissioners and Napoleon, by which the latter obtained the right of free passage for his troops through the Sardinian states; and the treaty that followed gave to the French republic Savoy, Nice, and the possessions of Piedmont to the westward of the Alps' highest ridge.

CHERBOURG, a fortified seaport t. and arsenal of France in the department of Manche, is situated at the head of a deep bay on the northern extremity of the peninsula of Cotentin, on the English channel, and opposite the w. coast of the isle of Wight, in lat. $49^{\circ} 40'$ n., and long. $1^{\circ} 35'$ west. Napoleon I. began to build the great defenses of this northern stronghold of France. His nephew, Napoleon III., developed his plans, but not with the original view of an invasion of England. Occupying a

prominent position on the French coast, only some 60 m. removed from the s. shore of England, the harbor-works have been extended, strengthened, fortified, and provisioned with cannon—the dockyards improved, and facilities of embarkation afforded. A description of the stupendous breakwater of C., inclosing a space of nearly 2000 acres, will be found in the article BREAKWATER. In connection with its fortifications, this breakwater assumes an importance that attaches to no other work of the kind in existence. At the apex of the angle formed by the meeting of the two branches of the breakwater or *digue*, there is a center fort or battery, measuring 509 ft. on the inner line of the parapet, which forms a flat semi-ellipse. The circular forts at the extremities of the breakwater are remarkably well placed for purposes of defense. Behind the center battery there is an elliptical tower, measuring 225 ft. on the major, and 123 ft. on the minor axis. The entrances to the harbor are round the ends of the mole; and the passages are further defended by the fortifications of the Ile Pélée, and by the batteries of La Roche Chavaignac and fort Querqueville. A series of coast redoubts, and the two large fortifications of Les Roches des Flamands and du Homet, are situated behind this outer zone of defense. Besides batteries on the mole, C. is defended by many regular forts and redoubts. The town itself is commanded by La Roule (an exceedingly strong fort) and fort d'Octeville on the heights behind. The military port of C. consists of an outer harbor of 776 ft. in length by 663 ft. wide, its minimum depth being 58 ft., and the entrance to which is 206 ft. wide at its narrowest point. This harbor communicates by means of a lock with a floating basin, 957 ft. long by 712 wide. The outer harbor has four building-slips for 120-gun ships, besides some smaller slips, and a fine graving-dock. In Aug., 1858, an inner floating-harbor was inaugurated by the emperor of the French, in presence of the queen and many of the lords and commons of Great Britain. This harbor, entirely cut out of the solid rock, has a length of about 930 yards, and a breadth of 437 yards, and is surrounded by beautiful building-slips and capacious graving-docks. It is calculated that the roads of C. cannot, on account of the small depth of the greater portion, shelter more than 25 or 30 sail of the line, and about as many frigates, at one time. C. has a safe and commodious commercial port quite distinct from the other, situated on the s.e. Among its industries are ship-building, sugar-refining, lace making, tanning and dyeing. C. is a very ancient place. It is thought by some to be on the site of the old Roman *Coriallum*, and the name was regarded as a corruption of *Cæsar's Burgum* or Cæsar's Borough. In the 11th century the castle is mentioned under the title of *Carusburg*. William the Conqueror constructed some buildings here, and Henry II. several times made it his residence. It was pillaged by an English fleet in 1295 and during the invasion of Normandy in the 14th century it frequently suffered. In the Hundred Years' War it was captured by the English (1418) after a siege of four months, but was regained by Charles VII. in 1450, after which it remained in the hands of the French. Louis XIV. attempted to make it a military fort, but the works were dismantled in 1689. In 1758 the English inflicted severe damages upon the fortifications. The great breakwater described above was begun by Louis XVI. Population, 1896, 40,783.

CHERBULIEZ, ANTOINE ÉLISÉE, 1797-1869; a native of Switzerland, professor of political economy in Geneva and in the national polytechnic school in Zurich. He was a contributor to cyclopædias and periodicals, and author of *L'Utilitaire*, and *Précis de la Science Économique*.

CHERBULIEZ, VICTOR, b. 1832; a Swiss author, the son of a Latin professor in Geneva. He has written many novels for the *Revue des Deux Mondes* (Paris), among them *Le Comte Kostia*; *Le Prince Vitale*; *Pauline Méré*; *Le Roman d'une honnête Femme*; *L'Idée de Jean Téletol*; *Samuel Brohl et Cie.*; *Noirs et Rouges* (1880); *La Ferme du Choquard* (1885); *La Vocation du Comte Ghislain* (1888); *The Tutor's Secret* (1893), etc. Under the name of "G. Valbert," he published papers on politics. He became a member of the French Academy, '81.

CHERIBON, or **SHERIBON**, a seaport t. of Java, situated on the n. coast, 125 m. e.s.e. of Batavia. It has a considerable trade in coffee, indigo, and teak-wood, and is the residence of a Dutch governor. Pop. 52,000.

CHERIMOYER, or **CHIRIMOYA**, *Anona cherimolia*, the most esteemed fruit of Brazil and Peru, now common and even naturalized in some parts of the East Indies, and other tropical countries of the old world. It is a fruit of most delicious flavor, is sometimes described as the finest of all fruits, and sometimes as inferior only to the mangosteen. It belongs to the same genus with the custard apple (q.v.). Both flowers and fruit emit a pleasant fragrance, but when the tree is covered with blossom, the odor is so strong as to be almost overpowering. The fruit varies from the size of an orange to 16 lbs. or upwards in weight. It is roundish, or heart-shaped. Externally, it is greenish, covered with small knobs and scales. The skin is rather thick and tough. Internally, the fruit is snow-white and juicy, and contains a number of small brown seeds.

CHEROKEE, a co. in n.e. Alabama, on the Georgia border, on the Coosa and Chattooga rivers, reached by the Selma, Rome, and Dalton railroad; 586 sq.m.; pop. '90, 20,459, inclu. colored. The surface is mountainous, and in large part covered with forests of pine and oak. Productions mainly agricultural. Co. seat, Centre.

CHEROKEE, a co. in n.w. Georgia, on the Etowah river, which is navigable by steamboats; 409 sq. m.; pop. '90, 15,412, includes colored. It has a rolling surface and fertile soil, yielding the usual agricultural crops. Co. seat, Canton.

CHEROKEE, a co. in n.w. Iowa, on Little Sioux and Maple rivers; traversed by the Illinois Central railroad; 576 sq. m.; pop. '90, 15,659. Agriculture is the chief business. Co. seat, Cherokee.

CHEROKEE, a co. in s.e. Kansas, bordering on Missouri and the Indian territory; 576 sq. m.; pop. '90, 27,770. It is an agricultural region, and is intersected by the Kansas City, Fort Scott, and Memphis railroad. Co. seat, Columbus.

CHEROKEE, a co. in s.w. North Carolina, the extreme point of the state, adjoining Georgia and Tennessee; 530 sq.m.; pop. '90, 9976. It has a mountainous forest-covered surface, and is little cultivated. Co. seat, Murphy.

CHEROKEE, a co. in e. Texas, between the Angelina and the Neches rivers, intersected by the International and Great Northern railroad; 1000 sq.m.; pop. '90, 22,975, includ. colored. It is in an excellent agricultural region, consisting of alternating woodland and prairie. Co. seat, Rusk.

CHEROKEES, in their own tongue called Tsanaghee, a tribe of Indians of the Indian Territory, J. S. Their original home was in the country now forming portions of Florida, Georgia, Alabama, Mississippi, and Tennessee. They were then in two great divisions, the Ottare, or Otari, dwelling in the mountainous districts, and the Airate, or Erati, occupying the lower lands; and they were further divided into seven clans, each of which prohibited intermarriage between its own members. They adhered to the English in early colonial times, formally recognized the king in 1730, and in 1755 ceded territory and permitted the establishment of English forts. The tribe was considerably advanced in civilization when the war of the revolution began. They clung to the royalist side, and in consequence their country was laid waste by American forces. They were subjugated after a few years of intermittent war, during which they lost much territory, and, by the treaty of Hopewell, Nov. 28, 1785, they acknowledged the sovereignty of the United States, and were confirmed in the possession of their hunting grounds. Then began the ever-recurring story of white man's encroachment and red man's resistance, with the ultimate advantage on the side of the intruders. By treaties in 1791 and 1798, portions of their territory were surrendered, and many of their people emigrated beyond the Mississippi. In 1817, the C. on the Arkansas numbered 3,000. Those who remained in their old territory abandoned hunting, and the greater portion of them lived by agriculture. But the white men of Georgia, who coveted their lands, demanded the removal of the remaining C. notwithstanding the great services which they had rendered (1812-15) in the war with England; and though the Indians were entirely peaceable, generally industrious, and were fast becoming Christianized by the efforts of Moravian missionaries and those of the American board, the clamor for their removal prevailed, and in July, 1817, they were forced to exchange their eastern lands for territory w. of the Mississippi. The end was not effected, however, without much trouble and bloodshed. Georgia passed laws extending over the territory of the C., by which the Indians were practically outlawed, deprived of citizenship, and prohibited from being witnesses. They appealed to the U. S. supreme court, and that body—which long afterward decided that a negro had no rights that a white man was bound to respect—refused the Indians the right to bring an action; and finally the general government confessed its inability to fulfill its own treaty obligations. But this inability did not prevent the federal government (in 1835) from making a treaty with a small portion of the tribe for the removal of the whole of them, and three years later an armed force was sent into their country to compel the removal. At that time the whole number of Indians in their old homes was about 27,000. The Indians were themselves divided; one section, led by John Ross, at first opposed, but at last directed the removal. Within a few years, after much difficulty and not a few murders, their removal was effected. Since their occupation of a share of the Indian territory, the C. have greatly advanced in learning and in material prosperity. About 1821, a member of the tribe invented an alphabet, and books and newspapers have been printed in their own language for half a century. In the late civil war, they at first favored the confederates, but the majority soon came over to the union side. Between the two armies, their territory suffered severely, and they were compelled to emancipate their slaves. The territory of the C. now amounts to about 5,000,000 acres, and they have, in the keeping of the United States, school and orphan funds to the amount of about \$1,600,000. They are governed by a national committee and council elected for two years, and a chief who is chosen for four years. In 1890, the C. numbered 29,599. Their public school system is admirable. They live in well-built villages, and are peaceable and industrious. Tahlequah is their chief town, and contains two colleges and a newspaper office.

CHEROOT. See TOBACCO

CHERRY, *Cerasus*, a genus or sub-genus of plants, of which the best known yields one of our most esteemed stone-fruits. This is usually regarded as a sub-genus of *prunus* (see PRUM), but is erected by some botanists into a distinct genus on very slender grounds, the most obvious distinction between the species of *cerasus* and the true species

of *prunus* being that, in the former, the young leaves are conduplicate, or folded up, and in the latter they are convolute, or rolled together. Two species are pretty generally regarded as the parents of the garden cherries usually cultivated, *prunus* or *cerasus avium*, and *P. cerasus* or *C. vulgaris*—the former having the underside of the leaves hairy and a small austere fruit; the latter having smooth shining leaves and a more juicy fruit. *C. avium* attains a height of 40 to 50 feet. *C. vulgaris* is a smaller tree. Both have white flowers in clusters or nearly sessile umbels, and both are generally regarded as natives of Britain, and of the middle and s. of Europe. In a wild state, they are usually called *GEAN* (*guigne*), and *C. avium* is frequently planted—not only because it is exceedingly ornamental when in flower, but also as a timber-tree, being of rapid growth, with firm, strong, close-grained wood, suitable for the purposes of cabinet-makers, turners, and musical-instrument makers. But according to some botanists, there is only one species, of which these are varieties; and according to others, *C. vulgaris* is a native of Syria and other parts of western Asia, and is only naturalized in Europe, having been first brought to Italy by Lucullus, after his victory over Mithridates (74 B.C.), from Kerasunt, on the coast of the Black sea, from whence it derives its name. The cultivated varieties of the *C.* are very numerous, and differ very considerably in size, color, and flavor. The fruit of the *C.* supplies the inhabitants of some parts of France with a principal article of food, especially the wood-cutters and charcoal-burners of the forests; and among their modes of preparing it is that of making it a principal ingredient in soups. It ripens in Norway and East Bothnia as far n. as lat. 63°. In some parts of Germany, the public roads are lined for many miles together with avenues of *C.* trees. Besides its use for the dessert and for preserves, the *C.* is extensively used for making liquors. See *KIRSCHWASSER*; *LIQUEUR*. Varieties of *C.* with double flowers, and with pendulous branches, are frequently planted for ornament in shrubberies, and few trees or shrubs are more beautiful. The *all-saints C.* produces flowers almost all summer, and even in autumn. Its fruit is small and rather acid.—The other species of *C.* are numerous. Some species are low, or even prostrate shrubs, as *C.* or *P. chama-cerasus*, the *GROUND C.* of the s. of Europe and of Siberia; and *C.* or *P. pumila*, the *SAND C.* of North America.—The genus or sub-genus *cerasus* contains also the different kinds of bird *C.* (q.v.) and choke *C.* (q.v.), including the American *WILD C.*, famous for its medicinal bark; the *MAHALEB* (*C.* or *P. mahaleb*) of the s. of Europe, and the *CAPOLLIM* (*C.* or *P. capollim*) of Mexico and Peru—the first famous for the fragrance of its flowers, and the second for the fragrance of its fruit; and the *Cherry-laurel* (q.v.).

CHERRY, a co. in northern Nebraska; formed 1883; drained by the Niobrara river; 5668 sq.m., pop. '90, 6428. Co. seat, Valentine.

CHERRY-LAUREL, or **LAUREL-CHERRY**, a name given to those species of *prunus* or *cerasus* (see *CHERRY*) which have evergreen leaves. They are also often called **LAUREL**. They have small flowers in long racemes, and small fruit; the fruit of a nauseous taste; and most parts of the plant, but particularly the leaves and kernels, remarkably abounding in hydrocyanic (prussic) acid, and therefore very poisonous.—The **COMMON CHERRY-LAUREL**, sometimes called the **BAY-LAUREL** or **LAUREL-BAY**, very often spoken of simply as the **LAUREL** or **COMMON LAUREL** (*prunus* or *cerasus lauro-cerasus*), is a shrub, sometimes of very large size, with ovato-lanceolate, convex, smooth, remotely serrated, shining, yellowish green leaves, and erect racemes of flowers. It is originally from Asia, but is now naturalized throughout the s. of Europe, and is one of the most common ornamental shrubs in Britain, where it suffers only from such severe frosts as are of rare occurrence. It is propagated by seeds, layers, and cuttings. Its leaves resemble bitter almonds in smell and taste, and contain in great abundance the same essential oil (see **ALMONDS**, **VOLATILE OIL OF**), rich in hydrocyanic acid. From these leaves, by maceration in water for 24 hours, and subsequent distillation, is obtained the *laurel-water* (q.v.), or *cherry-laurel water*, sometimes employed in medicine as a substitute for hydrocyanic acid, and which formerly was so much used as a poison. The leaves are sometimes employed also for flavoring puddings, sauces, etc., and are safer for such purposes than oil of bitter almonds, but ought to be used with caution.—Another species, also very common as an ornamental shrub in Britain, but not quite so hardy as the common cherry-laurel, is the **PORTUGAL LAUREL** (*prunus* or *cerasus Lusitanica*), a native of Portugal, a large shrub—sometimes a tree—with dark-green leaves and lateral racemes. It does not grow so well under the shade of trees as the common cherry-laurel.

CHERRY VALLEY, a village in Otsego co., N. Y., 68 m. w. of Albany, reached by way of the Delaware and Hudson railroad; pop. of the village, 1890, 685. The village was the scene of a massacre of Americans, Oct. 11, 1778, by Indians and Tories under direction of British officers; 16 soldiers of the revolutionary army and 32 inhabitants, nearly all women and children, were killed, and all others carried into captivity. Every house in the settlement was burned.

CHERSIPHRON, an architect of Crete, who, with his son Metagenes, built or began to build the great temple of Artemis at Ephesus, commenced about 600 B.C. The columns were erected about 40 years later. It was completed 220 years after its commencement, and a few years afterwards it was destroyed by fire on the night in which Alexander the Great was born. It was called one of the seven wonders of the world.

CHER^{SO}, an island of Illyria, belonging to Austria, in the Adriatic, 12 m. s.s.w. of Fiume. A bridge unites it with the adjoining isle of Lossini. It has an area of about 105 sq. m., with a pop., 1890, of 8300. Its surface is generally hilly and rugged, with forests in the north. The chief town is Cherso, at the head of a bay on the w. side. Pop. about 5000.

CHERSON[']. See **KHERSON**.

CHERSONESUS, the ancient name of several peninsulas and promontories in Europe, the most important of which are the Crimea (q.v.), *C. Taurica*; Gallipoli (q.v.), *C. Thracia*; and Jutland (q.v.), *C. Cimbrica*.

CHERT, or **HORNSTONE**, a variety of quartz, always massive, and having a kind of granular appearance and structure. It is common in the mountain limestone, oolite, and greensand formations; sometimes forms rocks; and often contains petrifications. It passes into common quartz and chalcedony, also into flint and flinty slate. Its colors are gray, white, red, yellow, green, or brown. The name C. is sometimes limited to the finer varieties, and the coarser are called hornstone.—The name C. is very commonly given to the silicious concretions which occur as nodules and layers in limestone rocks, like flints in the chalk. When these materials exist to such an extent as to render the limestone useless for economical purposes, it is said to be "cherty."

CHERTSEY (Anglo-Saxon, Ceort's Eye or Island), a t. in the co. of Surrey, on a low strip of land between the right bank of the Thames, here crossed by a stone bridge, and the brook from Virginia water, 20 m. w.s.w. of London. It is irregularly built, chiefly consisting of two long cross-streets, and is surrounded by villas. The chief trade is in malt and flour. Many vegetables are raised for the London market. Pop. '81, 9215. C. arose in a monastery founded in 666, and rebuilt in 964 by Edgar and the Benedictine monks. The South Saxon kings had a seat here during the heptarchy. Charles James Fox lived on St. Anne's hill, an abrupt elevation about a mile from the town. Cowley the poet resided in Chertsey.

CHERUB, in the plural *cherubim* or *cherubs*, is the Hebrew name of a winged creature with a human countenance, which in the Scriptures is almost always represented in connection with Jehovah, and especially as drawing his chariot-throne. Cherubim are first mentioned in the Old Testament as guards of paradise; a C. with a flaming sword hindered the return of the expelled human pair. In the Holy of Holies in the tabernacle, and afterwards in the temple, cherubim wrought in embossed metal were represented above the mercy-seat, or covering of the ark of the covenant, so that they appeared to rise out of it. Figures of cherubim were also wrought into the hangings of the Holy of Holies. The cherubim that appear in the visions of Ezekiel and the revelations of John depart much from the early representations. In Ezekiel they have the body of a man, whose head, besides a human countenance, has also that of a lion, an ox, and an eagle; they are provided with four wings, two of which support the chariot of Jehovah, and serve to fly, while the other two cover the body; the hands are under the wings, and the whole body is spangled with innumerable eyes. In the revelation, four cherubim, covered with eyes, and having six wings, surround the throne of Jehovah; the first has the face of a lion, the second of an ox, the third of a man, and the fourth of an eagle. This gave rise at a very early period to the symbolical figures of the four evangelists, the human countenance being associated with Matthew, that of the lion with Mark, of the ox with Luke, and of the eagle with John. Most Jewish writers and Christian fathers conceived the cherubim as angels; and Dionysius the Areopagite, in his *Celestial Hierarchy*, makes them a separate class in the first hierarchy. Most theologians also considered them as angels, until Michaelis showed them to be a poetical creation; and Herder, in his *Spirit of Hebrew Poetry*, compared them to the griffins that watch treasures, and other fabulous figures. In Christian art, they are generally represented as sexless figures, with wings from the shoulders, the legs also being either covered by wings, or having wings substituted for them. Very often they have also a glory round the head.

CHERUBINI, **MARIA LUIGI CARLO ZENOBIO SALVATORE**, an eminent Italian composer, was born at Florence on the 8th or 14th of Sept., 1760, and was the tenth child of a musician in the Pergola theatre. He began to study music at the age of six, under his father, and composition when nine years of age, under other teachers. His earliest work was a Mass and Credo in D, and by 1776 his list included a Te Deum and an oratorio. Granted an allowance by the grand-duke, he went to Bologna in 1778, spending there and at Milan, four years under Sarti, from whom he acquired his remarkable knowledge of counterpoint and fugue. In 1780 his first opera, *Quinto Fabio*, was produced, and was followed quickly by other dramatic works. In 1784 he went to London and held the post of composer to the king for one year. Here two operas, *La Finta Principessa* and *Giulio Sabino*, were brought out. In 1785 he visited Paris, and later, Turin, and produced *Ifigenia in Aulide* (1787-88), returning in 1788 to make Paris his home. *Démophon* (1788) indicated that he was adopting a new style, and *Lodoiska* (1791) proved that he had abandoned the light Neapolitan style of his earlier works. Among later operas were *Elise* (1794); *Médée*, (1797); *L'Hôtelier Portugaise* (1798); *Les Deux Journées*, also called *Die Wasserträger*, and considered his operatic masterpiece

(1800); *Anacreon* (1803); and *Ali Baba* (1833), a rewritten work, originally called *Koukourgi* (about 1793).

In 1795 Cherubini was appointed one of the *inspecteurs des études* in the new conservatory of music. In 1805 he went to Vienna to write an opera for the royal theatre, returning discouraged to France in 1806, and after a period of melancholia entered in 1808, during a casual visit to Belgium, on a new field of composition—sacred music, beginning with a Mass in F (1809), and after that date wrote little else. In 1814 he was made a knight of the Legion of Honor by Louis XVIII. In 1815 Cherubini visited London, where he composed a symphony and overtures for the Philharmonic Society. In 1816 he was appointed, with Leseur, musician and superintendent of the king's chapel, and in 1822 director of the Paris conservatoire, which he advanced to the high standard it still preserves. He died at Paris, May 15, 1842. Cherubini has been called "the link between classic idealism and modern romanticism." "His sacred compositions, notably the requiems in C and D (1817 and 1836) are distinguished by a severe grandeur, and his dramatic work by brilliant and original instrumental effects." His work on counterpoint (1835) is still a standard. See the memoirs of Berlioz; Bellasis, *Cherubini* (1874) with catalogue of compositions, and the memoir by Pougin; and Crowest's *Cherubini* (N. Y., 1890).

CHERUSCI, a German tribe first mentioned by Cæsar. They first dwelt n. of the Silva Bacensis, or Harz forest, but the exact boundaries of their territory cannot be ascertained. They are chiefly memorable in connection with their great leader Arminius, or Hermann, who, having formed an alliance with other German tribes, attacked and annihilated the Roman legions under Varus, in the forest of Teutoburg, 9 A.D. After the death of Arminius, internal strifes broke out among the C., and Tacitus says that they were subjugated by the Chatti, a neighboring tribe. Notwithstanding this, they again appear as the chief tribe in the military league of the Saxons about the end of the 3d century. In the beginning of the 4th c., they are included among the peoples who had leagued against Constantine, and towards the close of the same are still mentioned distinctively by Claudian.

CHER VII, *Anthriscus cerefolium*, an umbelliferous plant, which has been long cultivated as a pot-herb, and used in soups and for a garnish, etc., in the same manner as parsley. It is much more used in some parts of the continent of Europe than in Britain. It is a native of Europe, naturalized in some parts of England. The leaves have a peculiar, somewhat sweetish, pleasantly aromatic smell and taste, by which the plant may be known from its congener *anthriscus vulgaris* or *scandix anthriscus*, a poisonous weed, whose leaves have a disagreeable smell, and which is also distinguished by its hispid fruit. There is a variety of C. with large roots, for the sake of which it is cultivated.—The umbelliferous plant called **VENUS' COMB** or **SHEPHERD'S NEEDLE** (*scandix pecten* or *S. pecten veneris*), a native of Britain and of the continent of Europe, often found in corn-fields, and remarkable for the appearance and large size of its fruit, and another species (*S. australis*) which grows in the s. of Europe, have a taste and smell resembling C., and are used in the same way on the continent. **SWEET C.** or **SWEET CICELY** (*myrrhis odorata*; *scandix odorata* of the older botanists), a native of the s. of Europe and of some parts of Asia, common in the neighborhood of houses in Britain, although probably not a true native, is frequently cultivated in Germany under the name of *Spanish C.* or *anise chervil*. In Scotland, the plant is commonly called *myrrh* by the peasantry. Its smell is peculiarly attractive to bees; and the insides of empty hives are sometimes rubbed with its leaves, to induce swarms to enter.—The species of *cherophyllum*, coarse weeds, are also called chervil.

CHERWELL, a stream which falls into the Isis or Thames near Oxford, England. The river comes from the county of Northamptonshire into Oxfordshire, of which county it forms the western boundary for a considerable distance.

CHESAPEAKE BAY, the largest inlet on the Atlantic coast of the United States, being 200 m. long, and from 4 to 40 broad. Its entrance, 12 m. wide, has, on the n., cape Charles, in lat. 37° 3' n., and long. 76° 2' w.; and on the s., cape Henry, in lat. 36° 56' n., and long. 76° 4' w., both promontories being in Virginia. C. B. has numerous arms, which receive many navigable rivers, such as the Susquehanna and the Patapsco on the n., through Maryland; the James on the s.w., from Virginia; and the Potomac on the w., between these two states. Unlike the shallow sounds in North and South Carolina, this network of gulfs and estuaries, to say nothing of its noble feeders, affords depth of water for ships of any burden, virtually carrying the ocean up to the wharves of Baltimore and the arsenals of Washington.

CHESAPEAKE, a magisterial dist. of Elizabeth city, Va.; pop. '90, 9815. Chesapeake city is a vill. in same co.; on Chesapeake bay, near Fort Monroe, and on the New York, Philadelphia, and Norfolk railroad.

CHESELDEN, WILLIAM, an English surgeon and anatomist, was b. in 1688, at Barrow-on-the-Hill, in Leicestershire. He commenced his medical studies at fifteen, at twenty-three established himself as a lecturer on anatomy, and in the following year was elected a fellow of the royal society. He was afterwards appointed surgeon to St. Thomas's, St. George's, and Westminster hospitals, where he acquired great reputation as an operator. In this respect, few surgeons, if any, ever surpassed him. He died at

Bath, 11th April, 1752. C.'s principal works are *Anatomy of the Human Body* (1713), long a text-book on the subject in England; a *Treatise on the Operation for the Stone* (1723); and *Osteology, or Anatomy of the Bones* (1733). He also contributed several valuable papers to the philosophical transactions of the royal society.

CHESHIRE, a co. in s.w. New Hampshire, bordering on Vermont and Massachusetts, bounded on the w. by the Connecticut and drained by the Ashuelot river, and traversed by the Boston and Maine and the Fitchburg railroads; 784 sq. m.; pop. '90, 29,579. It has a hilly surface, with some mountains, the highest being Grand Monadnock. There are several small lakes and ponds in the county. The soil is fertile, particularly along the rivers. The chief productions are grain, potatoes, hay, wool, butter, cheese, and maple sugar; and there are also many manufactories. Co. seat, Keene.

CHESHIRE, a maritime co. in the w. of England, bounded n. by the river Mersey, and partly also by the Irish sea, in lat. 52° 56' to 53° 54' n., long. 1° 47' to 3° 11' west. Its greatest length from n.e. to s.w. is 53 m.; greatest breadth, 32; area, 1052 sq.m., of which only $\frac{1}{10}$ is uncultivated; circuit, 200 m., of which 8 are coast. The surface forms an extensive nearly level plain between the Derbyshire and Welsh mountains, well wooded, and studded with small lakes or meres, and chiefly occupied by grazing and dairy tracts, which are among the most important in England. This plain, comprising four fifths of the surface, rests on new red sandstone, and is crossed, near the middle, by a tract of high ground running s.w. from a promontory overlooking the Mersey, near the mouth of the Weaver, to Beeston castle rock, 366 ft. high. On the e. border of the co. is a line of new red sandstone hills. In the n.e. is part of the Lancashire coal-field. In the e. are large tracts of peat, and much of the co. is wet and rushy. The n.w. part of C. forms a hammer-headed peninsula called Wirral, about 8 m. broad, between the estuaries of the Dee and Mersey. Coal-measures appear on the w. side of this peninsula, as well as on the w. border of the main part of the county. The chief rivers are the Dee, Mersey, and Weaver, which are navigable. The Dee skirts the co. on the w. 55 m., and the Mersey on the n. for 40 miles. The Weaver rises in the e. part of the co., and runs 40 m. w.n.w. into the Mersey. The co. contains an almost unrivaled system of canals, including the celebrated Bridgewater canal, and is traversed by the main line of the London and Liverpool railway, and the Crewe, Chester, and Holyhead railway. The chief mineral products are rock-salt and coal. The rock-salt, discovered in 1670, and mined by gunpowder, is found near the Weaver and its branches, especially near Norwich, at the depth of 28 to 49 yards, in two beds, the upper one being 15 to 25 yards, and the lower one above 40 yards thick, under a stratum of hard rock, 25 to 35 yards thick. The mines, one occupying 35 acres, when lighted up, resemble a fairy palace sparkling with gems and crystal. Much salt is also made from brine-springs 20 to 40 yards deep. Coal is worked in the n.e. part of the county. There are also lead (with cobalt) and copper-mines, and in almost every part of the co. freestone, limestone, millstone, and marl are found. The climate is moist. The soil is mostly a clayey or sandy loam, with marl and peat, and very fertile. The soil and climate are well fitted for pasturing, dairy-farming, and cheese-making, which are the chief agricultural occupations. The hedgerows abound in oaks. C. is a manufacturing as well as an agricultural county. Its chief products are silk, cotton, ribbons, fancy goods, linen, shoes, hats, chemicals, nails, rope, files, etc. Shipbuilding is carried on to a considerable extent. Pop. in 1891, 730,058. The chief towns are Chester (the co. town) Macclesfield, Stockport, Congleton, Knutsford, and Birkenhead. The co. of C. returns 6 members to parliament. C. has some Roman roads, tumuli, barrows, remains of religious houses, and many old castles and halls. The 12th Roman legion occupied Chester till the 3d century. Egbert, in 828, added C. to the Anglo-Saxon kingdom of Mercia. William the conqueror erected C. into a co. palatine, under Hugh Lupus, with an independent parliament and 8 barons. Henry VIII. subordinated it to the English crown; but C. did not send representatives to the English parliament till 1549, and the separate jurisdiction ceased entirely only in 1831.

CHESNE, ANDRÉ DU. See DUCHESNE.

CHESNEY, CHARLES CORNWALLIS, 1826-76; a brevet-col. in the British royal engineers, who first attracted attention by *A Military View of Recent Campaigns in Virginia and Maryland*, published in 1863, which was followed two years later by *Campaigns in Virginia and Maryland*, both works having reference to the late civil war in the United States. The work from which he received the greatest fame at home was *Waterloo Lectures*. He published, also, *The Military Resources of Prussia and France*; *Recent Changes in the Art of War*; and *Essays in Modern Military Biography*.

CHESNEY, FRANCIS RAWDON, 1789-1872, a British soldier who projected and led the Euphrates expedition by an overland route to India in 1835-6. He was a brig. gen. in China in 1843, maj. gen. in 1855, and gen. in 1868. He wrote *Expedition for the Survey of Euphrates and Tigris*; *Observations on the Past and Present States of Fire-arms*; *Russo-Turkish Campaigns of 1828-29*; and *Narrative of the Euphrates Expedition*.

CHESS (Fr. *échecs*, Ger. *schach*). The origin of this, the most purely intellectual of all games of skill, has been much disputed; thus much may now be considered as certain, that, under the Sanscrit name of *chaturanga*, a game, essentially the same as modern C., was played in Hindustan nearly 5,000 years ago. In its gradual diffusion through the world in succeeding ages, the game has undergone many alterations and modifications, both in nature and in name; but marked traces of its early Asiatic origin and descent are still discerned by the learned in its nomenclature and other characteristics. From Hindustan, C. spread into Persia, and thence into Arabia. The Arabs, it would appear, in the 8th c., introduced the game into Spain and the rest of western Europe; and in England, chess-play seems to have been known prior to the Norman conquest. Into Constantinople, and probably some other cities of eastern Europe, the game may have been imported from Persia at a period earlier than its Moorish conveyance into Spain.

The original Hindu game was played on a board of sixty-four squares, as now, but by four persons, two being allied against two, as in whist. Hence the name *chaturanga*, from *chatur*, "four," and *anga*, "a member" or "component part." The name *shatranj*, used by the Persians and Arabs, is a corruption of the Sanscrit. The English, French, and other European names are derived from the Persian term *shah*, "king." *Check*, the warning when the king is in danger, is but another form of *shah*; in fact, "king" is sometimes used for "check," and in German *schach* is both the name of the game and the term of warning. The term *rook* is from the Sans. *roka*, Pers. *rukh*, meaning a ship or chariot; *pawn* is said to be from *peon*, an attendant, or foot-soldier.

The books written upon C. "would form a tolerably large library." Of works on the antiquities of the subject, we may mention Dr. D. Forbes's *History of Chess* (Lond. 1860). The best modern practical works on the art of chess-play are the *Chessplayer's Handbook*; *C. Praxis*; and *Chess: Theory and Practice*, by Staunton; Morphy's *Games at C.*, edited by Lowenthal; Jaenisch's *Treatise on the Openings*, translated by Walker; and Horwitz and Kling's *Collection of End-games*. See also O. Cordel, *Führer durch die Schachtheorie* (Berlin, 1888).

The game of C. is played upon a square board marked out into sixty-four square divisions, which are colored alternately black and white, in order the more clearly to determine and denote the respective movements of the several pieces. In placing the board for play, each player must always have a *white* corner square at his right hand. There are two sets of pieces, of opposite colors, of sixteen men each, and of various powers according to their rank. These sets of men are arrayed opposite to each other, and attack, defend, and capture, like hostile armies. The accompanying diagram will best explain the name, form, and place of each man at the commencement of the game:

BLACK.

Rook. Knight. Bishop. Queen. King. Bishop. Knight. Rook.
WHITE.

The superior officers occupying the first row on each side are called *pieces*; the inferior men, all alike, standing on the row immediately in front of the pieces, are called *pawns*. Their moves and powers, along with the peculiar terms used in C., may be briefly described as follows:

A *pawn*, at his *first* move, may advance either one or two squares, straightforward; but after having once moved, he can only advance a single square at a time. In capturing* an adverse piece, however, a pawn moves one square diagonally, either right or left; but the pawn never moves backward. On arriving at an 8th square, or the extreme line of the board, a pawn may be exchanged for any piece his owner chooses to call for, except a king; so that a player may have several queens on the board at once. If, on moving two squares, a pawn pass by an adverse pawn which has arrived at the 5th line, the advanced adverse pawn may take the other *in passing* in exactly the same manner as if the latter had moved but one square.

A bishop moves any number of squares diagonally, but diagonally only; therefore a bishop can never change the color of his square.

A knight moves two squares, so as always to change color—that is, he moves one square forward or backward, and one diagonally. On account of this crooked movement, he can leap over or between any surrounding pieces; and therefore a knight's check—unless he can be taken—always compels the king to move.

The rook, or castle, moves any number of squares forward, backward, or sidewise, but not diagonally.

The queen is by far the most powerful of the pieces, and moves over any number of squares, either in straight lines or diagonals, forward, backward, or sidewise; so that her action is a union of that of the rook and bishop. At starting, the queen always stands on a square of her own color.

The king is the most important piece on the board, as the game depends upon his safety. He moves only one square at once, in any direction, except when he *castles*—a term to be explained presently. The king cannot be taken; but when any other piece attacks him, he is said to be in *check*, and must either move out of check or interpose some one of his subjects, unless the checking piece can be captured. When there is no means of rescuing the king from check, he is said to be checkmated, and the game is over. Of course, the two kings can never meet, as they would be in check to each other. *Double-check* is when a piece, by being moved, not only gives check itself, but also discovers a previously masked attack from another.

Castling is a privilege allowed to the king once in a game. The move is performed either with the king's rook or queen's rook—in the former case, the king is moved to the king's knight's square, and the king's rook is placed on the king's bishop's square; in the latter case, the king is played to the queen's bishop's square, and the queen's rook is played to the queen's square. But the king cannot castle after having once moved, nor at a moment when he is actually in check, nor with a rook that has moved, nor when he passes over a square attacked or checked by an adverse piece, nor when any piece stands between him and the rook with which he would castle, nor when in the act of castling either the king or rook would have to capture an adverse piece.

A *drawn* game results from neither player being able to checkmate the other: thus, a king left alone on each side must of course produce a draw, as do also a king with a bishop, or a knight, against a king.

Stalemate, or the not being able to move either the king or any other piece, also constitutes a drawn game.

Odds is a term applied to the advantage which a stronger player should give to a weaker: thus, the removal of a rook or knight from the better player's forces may be fair odds; or if the players are more nearly matched, the one may give a pawn. When the odds of a pawn are given, it is always understood to be the king's bishop's pawn.

Gambit is a technical word implying the sacrifice of a pawn early in the game, for the purpose of taking up an attacking position with the pieces.

Supposing the worth of a pawn to be represented by unity, the following is a tolerable average estimate of the comparative value of the pieces: Pawn 1, bishop 3, knight 3, king 4, rook 5, queen 9.

The chess-men being placed, the players begin the engagement by moving alternately; each aiming to gain a numerical superiority by capturing his opponent's men, as well as such advantages of position as may conduce to victory.

The rows of squares running straight up and down the board are called *files*, those running from side to side are called *lines*, and those running obliquely across are termed *diagonals*.

The playing over the following short game will serve the learner as a little initiatory practice:

WHITE.

1. King's Pawn two.
2. King's Bishop to Queen's Bishop's 4th.
3. Queen to King's Rook's 5th.
4. Queen takes King's Bishop's Pawn, giving Black checkmate.

BLACK.

1. King's Pawn two.
2. King's Bishop to Q Bp's 4th.
3. King's Knight to K Bp's 3d.

* Taking is always performed by lifting the captured man from the board, and placing the captor on his square. The pawn is the only man whose mode of taking differs from his ordinary move.

The foregoing brief mode of giving a checkmate is called the *Scholar's mate*, and is often practiced upon young and unwary players. Any contractions used, such as "K" for king, "B" for bishop, etc., will readily be understood by the use of the diagrams.

In the conduct of the game, and in the practice of C., the following rules, precepts, and hints will be found very generally useful:

Play forth your minor pieces early, and castle your king in good time. You may sometimes delay castling with advantage, but not often.

Do not expect to be able to establish an enduring attack with half your forces at home.

Seek to let your style of play be attacking; and remember the gaining or losing of time in your measures is the element of winning or losing the game.

Never touch a piece without moving it, nor suffer yourself or your opponent to infringe any other of the laws of the game.

You will find, when first player, that the opening, springing from your playing 1st king's pawn two, and then your king's knight to the bishop's 3d, is one of the best that you can adopt; but do not adhere to any one opening only.

If you wish to adopt a purely defensive opening, you may play 1st king's pawn one, and follow up with Q P 2, and Q B P 2.

Next to playing with good players, nothing will conduce to improvement more than looking on at two expert players whilst they play. Wanting these advantages, it is best to play over openings, and actual games, from books or journals.

To prevent blunders and oversights, always endeavor to perceive the motive of your adversary's move before you play; and look often round the board to see that you are not losing sight of any better move than the one you intended, or that you are not suffering yourself to be tempted by a bait.

When an onlooker, never interfere.

Always endeavor to lose with good temper, and to bear your adversary's faults with a good grace.

THE LAWS OF CHESS.—The laws of C. are at present in a somewhat unsettled, unsatisfactory condition; but the following are the principal prevailing regulations of the game:

1. If any error have been committed in the placing of the board or men, either player may claim that the game shall be finished as it stands, after four moves have been completed on each side, but not else.

2. A move once made, by your having moved a piece and left hold of it, cannot be retracted.

3. If you touch a piece, you must play that piece; but as long as you retain your hold, you can play it where you like. If you touch a piece that cannot move, your opponent may compel you to play your king, unless the king be unable to move. When you touch your pieces for the mere purpose of adjusting them, you are bound to say so.

4. If you make a false move, your opponent may either cause you to retract it and move your king, or he may claim that the false move shall stand, or that you shall make a legal move with the same piece, at his pleasure.

5. If you touch one of your opponent's men, he may compel you to take that man; or if that be impossible, to move your king, provided he can move without going into check.

6. If on the king being checked, due notice is not given, the player whose king is attacked is not bound to notice it.

7. In every fresh game, except when one is drawn, the first move alternates.

8. Drawn games counting as no games at all, the player who had the first move in a drawn game is also entitled to it in the next. (This absurd regulation is fast becoming obsolete; and it is now a common agreement in playing a series of games, that the move shall invariably alternate.)

9. A player who gives the odds of a piece, is entitled to the first move.

10. The time for consideration of a move is not limited; but a player leaving a game unfinished without his opponent's permission, loses such game.

11. When at the end of a game one player is left with just sufficient superiority of force to win—such as a king and rook against king, king and two bishops, or king, knight, and bishop against king—he who has the greater force must give checkmate within fifty moves on each side, or else the game is adjudged to be drawn. This law is framed to prevent unskillful players from wearying their opponents by persisting in the attempt to accomplish what they are too untutored to effect; and it is perfectly just, since the allotted number of moves is amply large enough and to spare.

12. In case of any dispute about the laws, both players are to agree as to an umpire, whose decision is to be considered final.

As there is no branch of chess-study better calculated to advance the skill of a learner than the attentively playing over recorded games between first-rate players, we have given an example of a game played blindfold, simultaneously with five other games, by the celebrated American chess-player, Paul Morphy. This gentleman visited England and the continent of Europe in 1858, and in his contests with the best players fairly carried all before him, so that he soon ranked as the greatest chess-player living.

White—Mr. Morphy.

CHESS, or **CHEAT**, common names of the *bromus secalinus*, a plant of the order *graminaceæ*; a troublesome weed that frequently springs up in wheat-fields, the seed mixing with the true wheat, from which it can be separated only with difficulty. It was once generally believed among farmers that wheat itself was transmuted into chess.

CHEST, MILITARY, is a technical name for the money and negotiable securities carried with an army, and intended to defray the current expenses. In the regular military system, this department is managed by the commissariat.

CHEST, NAVAL. The name of C. has been given to certain funds, maintained for the benefit of seamen belonging to the Eng. navy. A fund, called the *Chest at Chatham*, was suggested so long ago as the days of Drake and Hawkins, for the relief of wounded and superannuated seamen. In 1590, all seafaring men in queen Elizabeth's service consented to a stoppage out of their pay of 2*d.* to 6*d.* per month, to support this fund. The money was not in those days, as it would be now, put out to interest; it was kept in a C., and hence the name given to the fund itself. During the 18th c., the system became organized in a better manner; but still the fund retained the name of C.; inasmuch that when the office was removed from Chatham to Greenwich, in 1803, it became the *Chest at Greenwich*. The C. is managed *ex officio*, and the accounts are annually laid before parliament. Handsome gifts are occasionally made to the fund by individuals. Disabled sailors receive a present sum of money, if not deprived of the power of earning a living; but if their injuries are more permanent, they receive a pension from the C., for one year, or for several years, or for life, paid half-yearly.

CHEST, or **THORAX**, in anatomy, is the part of the body which lies beneath the neck and above the abdomen (q.v.), constituting the uppermost of the two divisions of the trunk, or that which contains the heart and lungs, and is bounded externally by the ribs. The C. is somewhat conical in form, the broad or lower end of the cone being shut in by the diaphragm, a large muscular partition which projects upwards from the lower ribs, being convex towards the C., and concave towards the abdomen. In respiration (q.v.), the diaphragm descends by its own muscular contraction, while at the same time the ribs are drawn upwards and outwards by the intercostal muscles. The cavity of the C. is thus enlarged, the lungs are expanded, and air is drawn into them through the trachea or windpipe and bronchial tubes. The combination of bone, cartilage, muscle, and tendon entering into the composition of the C. is such as to permit of expansion-movement to the extent required, and yet to guard against over-expansion, which would be fatal to the delicate textures within. The bones of the C. are at the same time a powerful protection against external injury.

The structures forming the walls of the C. are: 1. The backbone or spinal column, divided into 24 vertebrae, 12 of which, called the dorsal vertebrae, form the thoracic portion. 2. Twelve ribs, attached to the transverse processes or projecting portions of the dorsal vertebrae, and ending in front in the costal cartilages, by which the ribs are connected with. 3. The sternum or breast-bone, which occupies the middle line. 4. The diaphragm (q.v.). See also **SKELETON**.

The contents of the C. are the heart, the great arteries and veins, the lungs, the

trachea or windpipe, the bronchi or branches of the trachea, leading to the lungs, the oesophagus or gullet, and the thoracic duct (q.v.), or general terminus of the lymphatic system of vessels, by which the chyle and lymph are discharged into the blood. The very great importance of these parts to life, and their great liability to deranged action, renders the C. the seat of a large proportion of the diseases which afflict humanity, and especially of those which end in death. Indeed, of the three organs which the great physiologist, Bichat, called the "tripod of life"—viz., the brain, heart, and lungs—the C. contains two; hence its condition in almost all diseases, and especially in fatal diseases, is an object of the utmost solicitude to the physician.

The diseases of the C. depend in some cases on alterations in its form, as by rickets (q.v.) and other diseases affecting the bones in early childhood or in youth, as by too tight lacing in girls. The lungs and air-tubes are subject to a great variety of diseases, among which the principal are consumption or phthisis pulmonalis, pneumonia, pleurisy, bronchitis or pulmonary catarrh. The heart is subject to pericarditis, endocarditis, and chronic organic disease of the valves, as well as to enlargement (hypertrophy), dilatation, and degenerations of its muscular texture. The aorta, or great artery, is often affected with degeneration of its walls, and occasionally with aneurism. The great veins are liable to over-distension, and to obstruction by tumors or by coagulation of the contained blood. The thoracic duct is also sometimes obstructed by external pressure; and the oesophagus has a number of diseases usually described in connection with the alimentary canal. Most of the diseases here referred to are described either under special articles, or under HEART and RESPIRATION, ORGANS OF.

The examination of the C. by physicians is now conducted not only by an investigation of the symptoms or obvious characters of the disease, but by a minute and elaborate examination into the physical condition of the contained organs by means of auscultation (q.v.), percussion (q.v.), measurement, etc. The application of these methods is too complicated and technical for explanation in detail, but their results will be shortly alluded to incidentally in the articles above referred to on the diseases of the chest. The name of Laennec (q.v.) will be long remembered in medicine as that of a great original observer, who has contributed more than any other to the progress of knowledge in this department.

CHESTER, a co. in s.e. Pennsylvania, on the Delaware and Maryland borders, traversed by the Pennsylvania, the Philadelphia, Wilmington and Baltimore, the Philadelphia and Reading, and other railroads; 764 sq. m.; pop. '90, 89,377. Co. seat, West Chester.

CHESTER, a co. in n. South Carolina, between the Catawba and Broad rivers. Area, 570 sq. m.; pop. '90, 26,660. Co. seat, Chester.

CHESTER, a co. in s. western Tennessee; 288 sq. m.; pop. '90, 9069. Co. seat, Henderson.

CHESTER, a city in Delaware co., Penn., on the Delaware River, 15 miles w.s.w. of Philadelphia. It was founded by the Swedes in 1644, and is the oldest town in the state. It contains churches, banks, library, electric street railways, public schools, an academy, and the Pennsylvania Military Academy; and the Swarthmore College, belonging to the Friends, and Crozer Theological Seminary (Baptist), are near the city. Chester has large manufactories of cotton and woolen goods, steel, boilers, and engines; but is most famous for its shipbuilding. The Delaware River Iron Shipbuilding Works, founded by John Roach in 1872, built many vessels for the navy, and fine steamships for the Old Dominion and Mallory's lines, and for the Pacific Mail Steamship Company. Pop. '90, 20,226.

CHESTER, an ancient and episcopal city, municipal and parliamentary borough, and river-port, the capital of Cheshire, on the right bank of the Dee, 22 m. from the mouth of its estuary, 16 m. s.e. of Liverpool. It stands on a rocky sandstone height, and is mostly inclosed in an oblong quadrangle of ancient walls, 7 or 8 ft. thick, nearly 2 m. in circuit, and with 4 gates, and now forming a promenade with parapets, where two persons can walk abreast. The two main streets cross each other at right angles, and were cut out of the rock by the Romans 4 to 10 ft. below the level of the houses. The houses in these streets are curiously arranged; the front parts of their second stories, as far back as 16 ft., form a continuous paved promenade or covered gallery, open in front, where there are pillars and steps up from the street below, with private houses above, inferior shops and warehouses below, and the chief shops of the town within. This arrangement, called the "rows," together with the ancient walls, and the half-timbered construction of many of the houses, with quaintly carved ornamental gables of the 16th c. render C. perhaps the most picturesque city in England. C. cathedral is an irregular massive structure of crumbling sandstone, 375 by 200 ft., with a tower of 127 feet. It was formerly the church of the abbey of St. Werburgh, and for 650 years was one of the richest in England. The cathedral grammar school was founded by Henry VIII. St. John's church, now partially in ruins, is supposed to have been founded by Ethelred in 698. Among other noted buildings are the castle built by William the Conqueror, the chapter-house, blue-coat school, museum, and diocesan training college. The Dee is crossed by a superb stone arch of 200 ft. span. Suburbs of villas have recently arisen outside the walls; and a public park, presented by the marquis of Westminster, was opened in 1867. The C. railway station is the center of several important railways, and

is one of the largest and finest in the kingdom. C. has manufactures of lead, iron-foundries, chemical works, and an iron-shipbuilding yard. It manufactures boots and shoes for export. C. has many charitable and religious institutions, and is the abode of many wealthy families. Pop. '91, 37,105. The city is a county in itself, and returns one member to parliament.

C. was *Devana Castra*, or Colonia Devana, an important Roman station, and has yielded many Roman remains—as masonry, coins, inscriptions, fibulæ, altars, a hypocaust, and a statue of Pallas. C. was only in 828 taken by the Saxons from the Britons. Its strength made it a refuge against the descents of the Danes and Northmen, but the Danes took it in 894. Ethelfrida retook it in 904, and rebuilt the walls. From the Norman conquest to the time of Henry III., the earls of C. had their own courts and parliaments at C., with 8 subfeudatories and the superiors of the great religious houses, C. being then a county palatine. Henry III. made his eldest son earl of C., a title held since by the prince of Wales. Llewelyn ravaged C. in 1255. The 25 famous C. mysteries or religious plays, by Randle, a monk (1250–60), were acted in the church. After a long siege, the parliamentary forces defeated those of Charles I. at C., and took the city. Pearson and Porteus were bishops of Chester. Trinity church contains the remains of Matthew Henry, the biblical commentator. The commerce of C. has steadily declined since the rise of Liverpool.

CHESTERFIELD, a co. in n.e. South Carolina, intersected by the Atlantic Coast Line railroad; 986 sq. m.; pop. '90, 18,468, includ. colored. Productions chiefly agricultural. Co. seat, Chesterfield.

CHESTERFIELD, a co. in s.e. Virginia, between the Appomattox and the James river, traversed by the Southern and the Atlantic Coast Line railroads; 465 sq. m.; pop. '90, 26,211, includ. colored. Coal is abundant, but agriculture is the chief business, and corn and tobacco are the principal crops. Co. seat, Chesterfield.

CHESTERFIELD, a municipal borough in Derbyshire, near the Hipper and Rother rivulets, 24 m. n.n.e. of Derby by rail. There are manufactures of leather, silk, lace, earthenware, and machinery; and there are several blasting-furnaces in the neighborhood. The manufactures are increasing rapidly, and the minerals in the neighborhood, including coal, iron, potters' and brick clay, slates, and lead, are being greatly developed. The population was, in 1851, 7,100; in 1891, 13,242. Trade is facilitated by a canal connecting C. with the Trent, and by the main line of the Midland railway.

CHESTERFIELD, Earl of (PHILIP DORMER STANHOPE), an English statesman and author, eldest son of the third earl of C., was b. in London, Sept. 22, 1694, and studied at Cambridge. In 1714, he made the tour of Europe, and the following year was appointed a gentleman of the bedchamber to the prince of Wales. About the same time, he was elected M.P. for St. Germans, in Cornwall. In 1726, on his father's death, he became earl of C., and in 1727 was sworn a privy-councillor. In 1728, he was appointed ambassador extraordinary to Holland, and in 1730 was made a knight of the garter and lord steward of the household, but soon resigned that office. An eloquent and frequent speaker, he took an active part in all the important business in the house of lords, and was for several years the strenuous opponent of sir Robert Walpole, then premier. In 1744, he connected himself with the administration, and in 1745 was reappointed ambassador to the Hague, but was soon nominated lord-lieut. of Ireland, where he rendered himself exceedingly popular. In Oct., 1746, he became one of the principal secretaries of state, but, two years after, declining health caused him to resign office, and in 1752 he was seized with deafness. Distinguished by brilliancy of wit, polished grace of manners, and elegance of conversation, he lived in intimacy with Pope, Swift, Bolingbroke, and other eminent men of the day. Dr. Johnson, whose dictionary, on its appearance, he affected to recommend, called him "a wit among lords, and a lord among wits." He wrote several papers, on temporary subjects, in *The Craftsman*, *The World*, periodicals of the time; but he is now best known by his *Letters to his Son*, Philip Dormer, written for the improvement of his manners. These letters have been often republished, and they afford a good idea of the mental and moral calibre of the author. Lord C. died Mar. 24, 1773.

CHESTERFIELD INLET, a long and narrow gulf, penetrating to the westward from the n.w. of Hudson's bay. Its extreme dimensions are 250 and 25 m.; and the lat. and long. of its mouth are 63° 30' n., and 90° 40' west. C. I. is studded nearly throughout with islands.

CHESTNUT, *Castanea*, a genus of plants of the natural order *cupulifere*, closely allied to the beech (*fagus*), and distinguished from it by long male catkins, longitudinally set with groups of flowers, a 5 to 8-celled ovary, and compressed rounded nuts. The name is derived from the town of Castanum, near Magnesia, in Asia Minor. The COMMON C., SPANISH C., or SWEET C. (*C. vulgaris*), is said to have been first brought from Asia Minor to Sardinia, and from thence to have gradually extended over the s. of Europe, where it has long been naturalized, and forms extensive woods. It is an ornamental, stately, or, in exposed situations, a very spreading tree, of great size and longevity; the still surviving C. of Totworth in England was known as a boundary-mark in the reign of king John. A celebrated C. tree on Mt. Etna measured 204 ft. in circumference of trunk. The C. has oblongo-lanceolate, acuminate, serrated, smooth leaves. The timber is dura-

ble and hard, and is used in house-building, for making furniture, and for many other purposes. The timber of the C. so much resembles that of the oak, as in old buildings to be distinguished with difficulty. The bark is used for tanning, but is worth only about half the price of oak-bark. Young C. trees are much esteemed for hop and espalier poles. The C. is therefore frequently grown in England as coppice-wood; but it succeeds well as a timber-tree even in Scotland, although it does not generally ripen its fruit. In Devonshire, however, and in some other parts of England, it is planted to a considerable extent as a fruit-tree. It succeeds throughout all the middle latitudes of Germany, but dislikes a damp foggy atmosphere. It prefers a dry light soil, and succeeds only where there is a dry subsoil. The nuts are generally two in each husk. They form a principal part of the food of the poor in the s. of Europe, being used either roasted or boiled, and often ground into flour, and made into a kind of bread. They contain 15 per cent of sugar, and by pressure yield a sugary juice, which readily undergoes the vinous fermentation, and from which a crumb-like kind of sugar may be obtained. The best kinds of chestnuts are called by the French *marrons*. When cultivated as a fruit-tree, the C. is generally grafted, by which means the better varieties are secured.—Other species of C. also bear eatable fruits: those of the AMERICAN C. (*C. Americana*), a tree much resembling the common C., and of the DWARF C., or CHINQUAPIN (*C. pumila*), a low tree, or more generally a shrub of 7 to 8 ft. high, are used in America. The fruit of the dwarf C. is of the size of a common hazel-nut; the nut is convex on both sides. The plant reaches its southern limit on the banks of the Delaware.—A number of species are natives of the east. The inhabitants of the mountains of Java eat the fruit of the SILVERY C. (*C. argentea*), and the TUNGURRUT (*C. tungurrut*), boiled or roasted, like the common chestnut. Both of these are large trees, the tungurrut reaching a height of 150 ft.—The horse C. (q.v.) is entirely different from the true chestnut. See *illus.*, HAZEL, ETC., vol. VII.

CHESUN COOK LAKE, an expansion of Penobscot river in Piscataquis co., Me., about 24 m. long by 2 to 4 m. wide.

CHEVAL GLASS (Fr. *chevalet*, an easel). A large mirror swinging in a frame.

CHEVALIER (Fr. *cheval*, a horse), in heraldry, a horseman armed at all points. In the more general acceptance it signifies a knight (q.v.). See also BANNERET and CHIVALRY.

CHEVALIER D'INDUSTRIE (French). One of the swell mob; a swindler. Synonyms are COQUIN, ESCROC.

CHEVALIER, THE YOUNG. This title was given by popular assent to the grandson of James II. of England, otherwise known as the Young Pretender (q.v.). See STUART CHARLES EDWARD LOUIS CASIMIR.

CHEVALIER, MICHEL, an eminent French economist, born at Limoges, Jan. 13, 1806, was at the age of 18 admitted a pupil of the polytechnic school. Thence he went to the school of mines, and some days before the revolution of July, he was attached as an engineer to the department du Nord. Led away by the theories of the St. Simonians, he was for two years editor of the *Globe*, the organ of that sect. Joining the schism of M. Enfantin, he took an active part in the compilation of the *Libre Nouveau*, the standard of their doctrines, and in 1832 suffered six months' imprisonment, on account of his free speculations in regard to religious and social questions, being regarded as an outrage on public morals. On his liberation, he at once retracted all that he had written in the *Globe* contrary to Christianity, and against marriage, and obtained from M. Thiers a special mission to the United States, to inquire into the systems of water and railway communication there. The results were published in his *Letters from North America* (1836, 2 vols. 8vo). After a visit to England, he issued a work, entitled *Material Interests in France: Public Works, Roads, Canals, Railways* (1838, 8vo). He was named, successively, chevalier of the legion of honor, councillor of state (1838), a member of the superior council of commerce, and of the royal council of the university; and in 1840, professor of political economy in the college of France. In 1840, he was re-established in the corps of mines as engineer of the first-class; and in 1846, elected a member of the chamber of deputies. Under the republic, he lost his various employments. He published, in 1848, *Letters on the Organization of Labor and the Question of the Laborers*; and after the *coup d'état* of Dec. 2 was restored to his professorship, and named councillor of state. In 1860, C. assisted Mr. Cobden in carrying into effect the commercial treaty between France and England, and was created a senator. He became a grand officer of the legion of honor, 1861. He d. at Montpellier, 1879.

CHEVAUX-DE-FRISE, in fortification, is a hastily constructed substitute for a regular abattis, to stay the progress of an advancing enemy. It may be constructed in any way of wood or iron, provided it presents an array of sharp or ragged points towards the enemy. Sometimes it is made of barrels or centers of timber, with spears springing out from all sides, in such a way as to constitute both a support and a defense. Among the *matériel* of an army under the care of the engineers, are sometimes comprised chevaux-de-frise formed of cylindrical iron barrels, about 6 feet long, each having 12 holes to receive as many spears; the spears can be packed away in the barrel, when not in use. Each such piece constitutes a *cheval*; and many such, ranged end to end, form *chevaux*, to be used in ditches around a fortification, on the berme beneath the parapet, behind

the glacis, across a breach in the rampart, or in any spot where a check to the storming-party is needed. At Badajoz, during the peninsular war, great service was rendered by a chevaux-de-frise formed of sword-blades fixed into beams of wood. The name is said to have been derived from "Friesland horse," and to have been first applied by the French during the wars of the 17th century. See *illus.*, *FORTIFICATION*, vol. VI., fig. 23.

CHEVERUS, JEAN LOUIS ANNE MADELEINE LEFEBVRE DE, D.D., 1768-1836; the first Roman Catholic bishop in New England. He was raised to the priesthood in 1790, and had a curacy at Mayence, in France; but on refusing to take the oath required by the assembly he went to England, and in 1795 came to America and joined the Roman Catholic mission in Boston. He spent some months in Maine as an Indian missionary. During the prevalence of the yellow fever in Boston his faithful and efficient service, without regard to sect or belief, made him remarkably popular, and when he started a subscription for funds to build a church of his faith, John Adams, then president of the United States, headed the list. In 1808, he was made bishop against his own protest. In 1823, he was recalled to France, and made bishop of Montauban, and still later bishop of Bordeaux and peer of France. He was appointed a cardinal Feb. 1, 1836.

CHEVES, LANGDON, LL.D., 1776-1857; a native of South Carolina; elected to the state assembly in 1808; and to congress in 1811, serving five years, for a part of the time being speaker of the house, in which position he gave the casting vote that defeated the rechartering of the U. S. bank; but in 1819 he became president of the same bank. He was chief commissioner in settling some of the provisions of the treaty of Ghent. In 1850 he was a delegate to the Nashville national convention, and in 1852, a member of the South Carolina state convention, in which he opposed a separate state secession.

CHEVET. See *APSE*.

CHEVIOT HILLS, a mountain-range occupying contiguous parts of the counties of Northumberland and Roxburgh, on the English and Scotch borders, and running 35 m. from near the junction of the Till and Tweed in the n.e. to the sources of the Liddel in the s.w. The highest points are C. hill, 2658 ft., and Carter Fell, 1850.

CHEVREUL, MICHEL EUGÈNE, a distinguished French chemist, b. Aug. 31, 1786, at Angers, in the department of Maine-et-Loire. In 1820, he was made an examiner in the polytechnic school; and in 1824, director of the dyeing department in the manufactory of the Gobelins. This last position led him to institute a series of accurate researches on colors, the results of which he made known in a series of *Mémoires* of the academy of sciences. Previous to this, C. had made himself known in the scientific world by a variety of researches and writings. In 1826, he was made a member of the academy; and in 1830, professor of applied chemistry in the museum of natural history. Besides a great number of articles in the *Journal des Savants*, beginning with 1820, the following works of C. deserve mention: *Leçons de Chimie appliquée à la Teinture* (1828-31); *De la Loi du Contraste simultané des Couleurs et de l'Assortiment des Objets colorés* (1839); *Théorie des Effets Optiques que présentent les Etoffes de Soie* (1846); *De la Baquette divinatoire, du Pendule, et des Tables tournantes* (1854); *Des Couleurs et de leur Application aux Arts Industriels* (1864); and a work on a new organic acid, *L'Acide Arigue* (1871). C. was a fellow of the Royal Society of London, and a Commander of the Legion of Honor. In 1886 the centenary of his birth was celebrated with great enthusiasm. In the same year Harvard university, on the 250th anniversary of its foundation, conferred upon him the degree of LL.D. He d. 1889.

CHEVRON, in heraldry, an ordinary representing the couples or rafters of a house, and supposed to betoken the accomplishment of some memorable work, or the completion of some business of importance, generally the foundation of his own family by the bearer. The C. is formed of two lines placed pyramidically, i.e., joined together at the top, and descending to the extremities of the shield in the form of a pair of compasses. *Chevronel*, a diminutive—half the size—of the chevron.

CHEVRON, in architecture, a molding in the form of a succession of chevrons, otherwise called a zigzag molding. In general, it is characteristic of Norman architecture, but is also found with the pointed arch, during the transition period from Norman to early English.

CHEVRONS, are badges consisting of stripes meeting at an angle, worn on the coat sleeves of non-commissioned officers, above the elbow on the dress coat and blouse, but below the elbow on the overcoat, the points down in all cases. The cloth chevrons are of the same color as the facings of the uniform, except those worn on the overcoat by infantry, which are of dark blue cloth. The engineers' chevrons are piped with white cloth. A corporal has two bars, a sergeant three bars, a first sergeant three bars and a lozenge. The various classified non-commissioned officers have especially distinguishing marks in addition to the bars, such as bugles, stars, crossed keys and pens, crossed hatchets, etc. All enlisted men are entitled to a diagonal half chevron for each term of enlistment, to be worn on both sleeves below the elbow. A diagonal half chevron of gold lace is also worn to indicate service in war. Service chevrons are not worn on the overcoat or blouse.

CHEVY CHASE, the name of perhaps the most famous of British ballads. In its present form, the piece does not seem to be older than about the beginning of the 17th century. But more ancient versions, doubtless, existed; and bishop Percy has published a poem of the 16th c., which has obviously suggested passages in the more recent composition. It is impossible to reconcile its incidents with history, but the event which is meant to be commemorated appears to have been the battle of Otterburn, in Aug., 1388—a fight which Froissart declares to have been the bravest and most chivalrous which was fought in his day. According to the ballad, Percy vowed that he would enter Scotland, and take his pleasure for three days in the woods of his rival, and slay the deer therein at will. Douglas, when he heard the vaunt, exclaimed, "Tell him he will find one day more than enough." Accordingly, at the time of the hay-harvest, Percy, with stag-hounds and archers, passed into the domains of his foe, and slew a "hundred fallow-deer and harts of grace." When the English had hastily cooked their game, and were about to retire, earl Douglas, clad in armor, and heading his Scottish spears, came on the scene. Haughty challenge and defiance passed between the potentates, and the battle joined. In the center of the fray the two leaders met: "Yield thee, Percy!" cried Douglas. "I will yield to no Scot that ever was born of woman!" cried Percy. During this colloquy, an English arrow struck Douglas to the heart. "Fight on, my merry men!" cried he, as he died. Percy, with all the chivalrous feeling of his race, took the dead man by the hand, and vowed that he would have given all his lands to save him, for a braver knight never fell by such a chance. Sir Hugh Montgomery, having seen the fall of Douglas, clapped spurs to his horse, dashed on Percy, and struck his spear through his body a long cloth-yard and more. Although the leaders on both sides had fallen, the battle, which had begun at break of day, continued till the ringing of the curfew-bell. Scotsmen and Englishmen claim the victory. When the battle ended, representatives of every noble family on either side of the border lay on the bloody greensward.

CHEWING-GUM. The habit of chewing gum is, perhaps, peculiar to the United States, and it has rapidly spread until it is no uncommon thing to see boys and girls passing along the streets engaged in the practice. The gum is now prepared from the sap of the Chicle, a Mexican tree similar to the india-rubber tree, and it was first imported in 1867 for the purpose of using it in india-rubber manufacture. The preparation is sweetened, and may be flavored with peppermint, licorice, tolu or other extracts. Spruce gum is also much used and many prefer it to the other.

CHEWINK, the popular name for the ground robin, or towhee bunting, *pipilo erythrophthalma*. It is of variegated colors, red, white, and brown, is about 7 or 8 in. long, nests on the ground, and flies with a peculiar jerky motion. It lives in thickets, and finds its sustenance in seeds and worms scratched up from leaves and grasses.

CHEYENNE, a co. in eastern Col., on the Kansas border, formed from parts of Elbert and Bent; 1800 sq.m.; pop. '90, 534. It is watered by Big Sandy creek and other streams. Co. seat, Cheyenne Wells.

CHEYENNE, a co. in n.w. Kansas; formed 1873; intersected by Republican river; 1020 sq. m.; pop. '90, 4401. Co. seat, St. Francis.

CHEYENNE, a co. in s.w. Nebraska, on the Colorado and Wyoming border, intersected by the n. and s. forks of the Platte; 3288 sq. m.; pop. '90, 5693. The Union Pacific railroad passes through the s. part. Co. seat, Sidney.

CHEYENNE, a city, capital of Wyoming, and co. seat of Laramie co.; on the Union Pacific railroad, where it is joined by the Kansas Pacific, 100 miles n. of Denver, Col. It is on a broad open plain, 6,075 ft. above tide, with streets wide and regular; contains the workshops of the Union Pacific railroad; and has lignite and iron mines in the vicinity. The main business is in receiving and distributing supplies for Indian agencies and government forts. There are, however, many manufactories, and a rapidly growing general business. The place was first settled in 1867, when the Union Pacific railroad reached that point. In 1869, a large portion of the city was destroyed by fire. It now has costly waterworks, electric lights, telephones, etc. Pop. '90, 11,690.

CHEYENNES, an Indian tribe of the Algonquin family, once residing on and near the Cheyenne river, a tributary of the Red River of the North. Driven away by the Sioux, they retired beyond the Missouri, and about the beginning of the century they were further driven to the Black Hills region. In 1825, the first treaty with them was made by Gen. Atkinson. Since then many treaties have been made, and almost all of them immediately broken by the whites, and constant trouble has been the result. The fearful and cold-blooded massacre of nearly a hundred men, women, and children of this tribe, led by Col. Chivington, of Colorado, in Nov., 1864, led to war that cost the U. S. government \$40,000,000, and so embittered the Indians that a permanent peace can hardly be looked for. In 1867 Gen. Hancock burned some of the villages, and began or rather continued a state of war, in the course of which Gen. Custer defeated them at Washita, where Black Kettle, a chief, and two or three dozen squaws and papooses were killed. The revenge taken upon Custer a few years later will not soon be forgotten. In '77, the Cheyennes were removed to the west part of the Indian territory where, in common with the Arapahoes, they occupy a reservation of 6,715 sq. m. They numbered, '82, about 3,600.

CHHATISGARH, a division of British India under the jurisdiction of the commissioner of the central provinces, comprising the districts of Raipur, Bailapur, and Sambalpur. and seven small feudatory states. Pop. 1880, 4,612,705.

CHIABRERA, GABRIELLO, an Italian poet, b. at Savona, 8th June, 1552. He was educated at Rome under the care of his uncle, after whose death he entered the service of cardinal Cornaro, but was obliged to leave it in consequence of the revenge he had taken on an Italian nobleman who had done him an injury. In his 50th year he married, and remained independent for the rest of his life. He died 14th Oct., 1637. C.'s poetical faculty developed itself late. Having commenced to read the Greek writers at home, he conceived a great admiration of Pindar, and strove successfully to imitate him. He was not less happy in catching the naïve and pleasant spirit of Anacreon; his canzonetti being distinguished for their ease and elegance, while his *Lettere Famigliari* was the first attempt to introduce the poetical epistle into Italian literature. C. also wrote several epics, bucolics, and dramatic poems. His *Opere* appeared at Venice, in 6 vols., 1768.

CHIANA (in ancient times, *Clanis*), a river in Tuscany, formed by several streams from the Apennines, and falling into the Arno a few miles below Arezzo. Along with another river of the same name, which, flowing in the opposite direction, enters the Paglia at Orvieto, it waters the perfectly level Val di Chiana, which its overflow rendered once the most pestilential district of Italy. Ferdinand III. and his minister, Fos-sombroni, undertook extensive hydraulic works for improving the bed of the river, which they led through the lakes of Montepulciano and Chiusi, and employed for the artificial irrigation of the whole valley. The district has since become the most fruitful, perhaps, of all Italy—a perfect garden, supporting a pop. of more than 100,000.

CHIANTI, an Italian mountain-range in the province of Siena, clothed with olive and mulberry trees and vines. The mountain gives name to an excellent red wine grown there. This wine is now regarded as among the finest of Italian wines, being full flavored and astringent, with an alcoholic strength equal to about twenty per cent. of proof spirit.

CHIAPA, or **CHIAPAS**, a state in the s.e. of the Mexican confederation, lying to the s.w. of Yucatan, and extending in lat. between 16° and 18° n., and in long. between 90° 30' and 94° west. It contains 27,222 sq. m., and (1895) 313,678 inhabitants, chiefly aborigines. Near Palenque, one of the towns of C., are some of the most extensive and magnificent ruins in Central America. Capital, San Cristobal.

CHIARI, a t. of Lombardy, 14 m. w. of Brescia, on the railway between that place and Milan. It is an ancient place, many Roman remains being still found here; and at one time it was strongly fortified, but its walls are now ruinous. Silk is the staple manufacture. Pop. 9,000.

CHIAR-OSCURO (Ital.), an artistic term, composed of two Italian words, the one of which signifies light, the other darkness or shadow. But C. signifies neither light nor shadow; neither is it adequately described by saying that it is the art of disposing of both the lights and shadows in a picture, so long as either is regarded apart from the other. It is rather the *art of representing light in shadow, and shadow in light*, so that the parts represented in shadow shall still have the clearness and warmth of those in light, and those in light the depth and softness of those in shadow. It is not the making of the one die softly and gradually away into the other, but the preservation of both in combination, as we constantly see it in nature, when the light is not the mere glare of the sun striking on a particular object, nor the shadow the entire absence of the influence of light. That the skillful treatment of C. is a matter of extreme difficulty, is plain enough from the very small number of artists who ever attain to it. Still it is a branch of art without the mastery of which no painting can be successful in any department. It is as indispensable in portrait-painting as in the highest departments of ideal art; and though a just and even a lofty conception of the subject may be distinctly indicated by attention to form alone, it is impossible that its realization can ever be satisfactorily accomplished by any one who has not mastered this most subtle mode of handling colors. The only mode by which a knowledge of C. can be attained, so as to apply it to practice, is by studying it as exhibited by such painters as Titian, Rubens, Rembrandt, and, above all, Correggio.

CHIASMUS. See SYNTAX, FIGURES OF.

CHIAVA RI, a maritime t. of Piedmont, situated on the gulf of Rapallo, at the mouth of the Sturla, 21 m. e.s.e. of Genoa. The houses in general are well built, with open arcades skirting the narrow streets. C. has several fine churches, the principal of which is the *Madonna del Orto*. Numerous picturesque old towers, one of them of considerable size, are scattered over the town. Lace and silk are manufactured here; and the place is also noted for its light, handsome, cheap furniture, made chiefly of cherry-wood. The anchovy fishery is important; and in the vicinity are extensive slate-quarries. Pop. 12,000.—The old province of C., of which the above town was the capital, had an area of 155 sq.m., with a pop. of 109,000. Its surface is generally mountainous, but it has valleys of great fertility, yielding grain, grapes, olives, etc.

CHIAVENNA, a t. of Lombardy, beautifully situated in the midst of vineyards, at the junction of the valley of St. Giacomo and Val Bregaglia, 38 m. n.n.w. of Bergamo. It is overlooked by the Rhetian Alps; and its position on the Splügen road secures it

considerable traffic. Silk, cotton, and a coarse ware cut out of a soft stone found in the neighborhood, are the chief manufactures. Pop. about 5000.

CHIBOUQUE, or **CHIBOUK**, a tobacco pipe used in Turkey and Egypt, having a long wooden stem, often of valuable material, a mouthpiece of glass or amber, and a bowl of baked clay.

CHIC, in common parlance, is a word of modern English slang, but of German origin. Its derivation is *geschick*, the meaning of which is skill, address, dexterity. The term is used in painting to express the art of giving efficiency in the most dexterous manner possible, with ability and adroitness closely united. The word is also employed in connection with fashion—and spoken of in this sense, means style, manner, grace and “go.” Although of German origin, it has been received into general usage through the French—a language which fixed the present form of the word. It is also synonymous with knack—*Cet artiste a du chic*, means, “that artist has great facility.” Another idiom much used is, *avoir du chic*, to be “up to it,” to be a “swell.”

CHICA, a red feculent substance, valuable as a dye-stuff, giving an orange-red color to cotton. It is obtained by boiling the leaves of a species of *bignonia* (*b. chic*), a native of the banks of the Cassiquiare and the Orinoco. The Indians use it for painting their bodies. The *C.* plant is a climber, with abruptly bipinnate leaves, smooth heart-shaped leaflets, and flowers in pendulous axillary panicles. See **BIGNONIACEÆ**.

CHICA, **PITO**, **POSO**, or **MAIZE BEER**, is a fermented liquor made from maize or Indian corn. It is much used in some parts of South America, and is made in a similar manner to ordinary beer; but the Indians sometimes prepare it by chewing instead of crushing the grain; and that which is so prepared (*chica cascada*, or chewed *C.*) is most highly esteemed by them. When they wish to make this liquor particularly strong and well flavored, they have also a practice of pouring it into an earthen jar, which contains some pounds of beef; and having made the jar perfectly air-tight, they bury it several feet deep in the ground, where it is left for several years. On the birth of a child, it is their custom thus to bury a jar of *C.*, to be drunk at the same child's marriage. *C.* has an agreeable flavor, and is very strong and intoxicating.

CHICA (*Sp.*), a lively dance, popular in Spain and in South America as well; possibly of Moorish origin. Some etymologists would connect the word with the French *gigue*, and the Italian *giga*.

CHICAGO, port of entry; county seat of Cook co., Illinois; principal city of the state, and second in population in the U. S.; on the s.w. shore of lake Michigan, at the mouth of the *C.* river, and 18 m. n. of the extreme s. point of the lake; lat. 41° 53' 3" n.; long. 87° 38' w.; distant in a direct line 715 m. w. by n. of New York; 590 m. n.w. from Washington; 260 m. n.e. from St. Louis; 500 m. e. of Omaha.

The name *C.* (pronounced She-kaw-go), according to one derivation, is simply a corrupted form of the Indian She-gau-ga-wiuzhe, meaning skunk-weed or wild onion, and was given to the locality from the abundance of that plant. The site was visited by Joliet and Marquette in Sept., 1673, and in 1674 by Marquette, who spent most of the winter near by. Later, it was a halting-place for La Salle, Hennepin, and others, and on a map (Franklin's) published at Quebec, 1685, was designated as “Fort Chicagou,” a circumstance indicating the existence of a trading post. The earliest settler, other than the aborigines, was Baptiste Point De Saible, a mulatto from San Domingo, who resided there from 1790 on for a few years, disposing of his pre-emptive claim to one Le Mai, a French fur trader who, in 1804, sold out to John Kinzie, the first permanent white American settler. In 1804 the U. S. built Fort Dearborn at this point. In 1812 orders were sent to abandon it, and the evacuation occurred Aug. 15, but the troops were massacred on the march by their Indian escort, and on Aug. 16 the fort was burned. It was rebuilt in 1816, and garrisoned until 1837. In 1830 the settlement comprised about $\frac{1}{2}$ sq. m., and had a civilian population not exceeding 100. By 1833, this had increased to 350, and on Aug. 10 the town, then spread over 560 acres, was organized. On Feb. 10, 1835, a special charter was granted, describing the area of *C.* as including 2 whole sections and 3 fractional sections of land. In that year (Nov. 26), the first newspaper was issued. In 1837, Mar. 4, *C.* was incorporated, and on May 2 the first election was held, when 700 votes were cast.

The great fire of Oct. 8-9, 1871, raged two days and nights, burning over an area of 2100 acres, and destroying more than 17,000 buildings, including the principal stores, many private residences, 33 hotels, 41 churches, 10 theaters and halls, and all the national banks but one. The total loss was estimated at \$190,000,000, and of this a little more than \$40,000,000 was recovered on insurance. Not less than \$7,000,000 were contributed in this country and in Europe to aid the sufferers, over 98,000 of whom lost their homes. The recovery of the city was rapid, and within three years' time few traces of the disaster could be seen. In July, 1874, another fire laid waste a large portion of the city. On May 4, 1886, an anarchist riot occurred in which 6 police officers were killed and several wounded. Eight persons were convicted and 4 were hung. In 1890 Congress fixed upon Chicago as the site for the World's Fair in 1893, commemorating the discovery of America.

The city's territory, prior to July, 1889, was 47 sq. m. In that month 127 sq. m. were added, including the towns of Jefferson and Lake, and the village of Hyde Park, making a total area of 174 sq. m., which was subsequently increased to 189 sq. m.

C. extends along the lake about 24 m., and westward, 6-11 m. Although it is 592 ft. above the sea, it originally stood on a low, flat prairie from 8-10 ft. above the lake. The grade of a large portion was raised, block after block of stores, hotels, etc., being lifted to the required level. Its grade is now 14 ft. above the lake on the e. side, and 28 ft. at the w. extremity. The shore at the mouth of the Chicago presents an even line extending nearly due n. and s. A portion of the n. shore is protected by a massive wall. The city is divided into 3 sections, popularly called the n., s., and w. divisions by the sluggish C. river and its two branches, one of which runs from n. to s., and the other from s. to n. The junction occurs about $\frac{1}{2}$ m. from the lake, and from here the course of the river is due e. The stream, with its branches, is navigable for about 4 m. from its mouth, and the entire river frontage, including docks, is 41 m. Two tunnels under the river, used by cable cars and pedestrians, connect the n. and s., and s. and w. divisions, respectively. The mouth of the river, formerly a sluggish bayou, has been deepened by piers that extend into the lake on either side, giving an entrance way about 500 ft. wide; and long breakwaters on the e. and s.e., constructed by the U. S. government, form an outer harbor, with an average depth of 16 ft., and an area of about 455 acres. Additional protection to vessels is given by an exterior breakwater, 5436 ft. long, that extends in a n.e. direction about a m. n.e. of the river's mouth. The shore end of the north pier has a lighthouse and the lake end a beacon light. There is also a beacon light on the s. end of the easterly breakwater. At South Chicago, at the northern mouth of Calumet river, is another harbor 300 ft. wide between piers. The water communications are of vast extent, embracing the whole chain of northern lakes, with their 3000 m. of coast-line. Steamboats and sailing-vessels of the largest class are employed in commerce with lake Superior, bringing down vast stores of iron and copper ore from that region; while through the Welland canal (around Niagara falls) connecting lake Erie with lake Ontario, vessels loaded at C. pass eastward to Montreal, where connection is made with steamships for Europe. The Erie canal through New York is also a commercial highway for C. to the ports of the Atlantic seaboard. The Illinois and Michigan canal for boats of 140 tons, was constructed 1836-48, and gives communication with the Mississippi and its affluents during 9 months of the year. This extends to La Salle, the head of navigation on the Illinois; is 96 m. in length, and at its highest level was originally 12 ft. above the lake, but in 1866-70 the city deepened it, and it is now 8½ ft. below the ordinary level of the lake. The river channel was also deepened, so that the lake no longer receives its waters, but itself furnishes a clear stream, flowing the other way, giving improved navigation and carrying off the sewage of the city toward the Illinois at the rate of a mile an hour. One of the greatest engineering and sanitary works of the country is the drainage channel and waterway, begun in 1891, and to be completed in 1897, at an estimated cost of \$30,000,000. It will be 30 miles long, and was planned with a view of having it converted into a ship canal ultimately.

RAILROADS.—The water channels are not more important than the network of railroads by which Chicago is put into rapid communication with all parts of the union.

There are fifty-three railroad lines and branches, operating 83,500 miles, converging in and tributary to Chicago and connecting it with every state, Canada and Mexico. Among the roads directly connected are the Chicago and Alton; Chicago, Milwaukee and St. Paul; Chicago and Central Illinois; Chicago, Burlington and Quincy; Chicago and Eastern Illinois; Chicago and Northwestern; Chicago and Atlantic; Chicago and Grand Trunk; Chicago, Rock Island and Pacific; Pittsburg, Fort Wayne and Chicago; Illinois Central; Michigan Central; Baltimore and Ohio; Lake Shore and Michigan Southern; Pittsburg, Cincinnati and St. Louis; Wabash, St. Louis and Pacific. By means of a "belt line," freight is transferred from one road to another without delay.

STREETS AND PARKS.—The streets cross at right angles, are generally 80 ft. wide, while some are 5-9 m. long. There are over 2500 miles of streets and alleys. The scarcity of stone has led to the use in some sections of wood, cinders, and gravel. The main aves. are parallel with the lake. Of these, Michigan, Washington, Dearborn, Prairie, Calumet, and La Salle are conspicuous for their elegant mansions. The river and canal are spanned by fifty-four bridges, and there are also thirty-nine viaducts over railroad tracks. There are several street railroad lines covering the city and suburbs, and an elevated railroad opened in 1895; the street railroads are principally electric and cable lines. Many of the streets are lighted by the electric light underground system, and the total cost of lighting the streets and parks is nearly \$1,000,000 per annum.

The public parks have a total area exceeding 2500 acres. The larger of these are connected by boulevards 250 ft. wide, extending around the city and forming a continuous drive of more than 30 m. Lincoln park (310 acres) is in the n. division. To the s.w. lie Humboldt park (200 acres) and Garfield park (185 acres). Within the limits of the latter is the Jockey driving park; s.e. of Garfield is Douglas park (179 acres), and still farther to the s.e. are the South parks: Jackson, Washington, Gage, and Midway Plaisance (aggregating 1057 acres). Besides these principal parks the city is possessed of eight smaller squares known as Lake, Ellis, Campbell, and Holstein parks, and

Aldine, Biekerdike, Washington, and Douglas Monument Squares. The Lake Front park contains 20 acres. Among notable public monuments are the statues of Lincoln and Humboldt, in the parks named after them, the mausoleum and statue of Stephen A. Douglas in Douglas Monument square, the equestrian statue of Gen. Grant in Lincoln park, the equestrian statue of Gen. Logan in Lake Front park, and the Confederate monument in Oakwood Cemetery dedicated in 1895. There are numerous cemeteries, the largest being Graceland and Rose Hill. Within the city limits are three lakes: Calumet, with an area of 3123 acres, Hyde lake and part of Wolf lake.

BUILDINGS. — Owing to the concentration of business in a limited area, Chicago has become celebrated for its mammoth buildings, called "sky-scrapers," erected on the steel-frame system; but by a strict city ordinance, the height of buildings is limited to 150 feet. The centre of the business quarter is the Court House and City Hall, a magnificent twin building of limestone, with granite columns in French Renaissance style. It fills an entire square, and cost nearly \$5,000,000. The east half is used for county purposes and the west half by the city. In the space between the buildings is the Drake fountain, erected in 1892, with a bronze statue of Columbus. La Salle street, running south from the City Hall, contains some of the finest office buildings. The most prominent are the Chamber of Commerce, one of the finest commercial structures in the world, costing more than \$1,000,000, fourteen stories high, the great central court roofed by the largest skylight in the world, and the interior richly furnished, with marble wainscoting and mosaic floors; the Tacoma building; the Temperance Temple, a combination of Gothic and French architecture, thirteen stories high, costing \$1,100,000. It consists of two great wings united by a narrow middle portion, resembling the letter H. From the roof springs a bronze spire 70 feet high, surmounted by a female figure. The Home Insurance Building is eleven stories high, with a superb entrance, and an interior decorated with beautiful marbles. The Rookery, a Romanesque building of granite, brick and terra cotta, eleven stories high, contains 600 offices elaborately finished, and cost \$1,500,000. The Board of Trade, at the foot of La Salle Street, is an enormous granite building, with a tower 322 feet high, giving a magnificent view. The Exchange Hall is 174 feet long by 155 feet wide. Nearly opposite is the Royal Insurance Company, an Ionic building, with a beautiful façade elaborately carved. To the east on Jackson Street is the Custom House and Post Office, occupying an entire block. In this vicinity are five great buildings, sixteen stories high: the Great Northern Hotel, the Maun, the Fair Building, the Manhattan, and the Monadnock-Kearsage, costing \$3,000,000, built entirely of steel, and finished in granite and marble. Next to the last is the Union League Club, the most sumptuous club-house in Chicago. North of the Custom House is the Rand & McNally Building, one of the largest and finest publishing houses in the world. On the same street is the wholesale establishment of Marshall, Field & Company, designed by Richardson. At the corner of Monroe and South Clark Streets is the First National Bank, containing the largest banking room in the world. On Michigan Avenue and Congress Street is the Auditorium, the most magnificent building in Chicago, erected in 1887-89 at a cost of \$3,500,000. It includes a large hotel facing the Lake, and one of the most beautiful theatres in the world. The longest front of the building is 360 feet, and the height of the main building is 145 feet. The tower, commanding a magnificent view, is 270 feet high. Part of it is occupied by the United States Signal Service. The main entrance, on Congress Street, leads to a beautiful court, with an elaborate mosaic floor, and decorated with marble, bronze, stained glass and gold. The grand staircase of marble and bronze is one of the finest in the United States. The theatre, which will seat 4100 persons, is luxuriously furnished and decorated with beautiful mural paintings. The stage is most completely equipped, and comprises 6862 square feet. The magnificent Studebaker Building, adjoining the Auditorium on Michigan Avenue, is one of the show buildings of Chicago. North of it is the beautiful Romanesque Chicago Club House. Two blocks above, on the Lake Front, is the beautiful new building of the Art Institute, 320 feet long and 208 feet wide, containing valuable collections, picture galleries, a library and a lecture-hall. At the end of Michigan Avenue, at the Chicago River, is the site of Fort Dearborn, marked by a tablet. On State Street, north of Madison, is the Spanish Renaissance Columbus Building, completed in 1893, at a cost of \$800,000. It is fourteen stories high, with a tower 240 feet high, tipped with a globe of opalescent glass lighted with a powerful electric light. Over the entrance is a bronze statue of Columbus, and in the interior are two glass mosaics, representing scenes in his life. On the opposite corner is Marshall Field's retail store, in the centre of the shopping district. Adjoining it is Central Music Hall, and on the corner above is the Masonic Temple, said to be one of the finest buildings in the world. It has twenty-one stories, and its height is 265 feet. Seventeen floors are devoted to business, and the remainder, used by the Masons, is magnificently finished. Diagonally opposite is Unity Building, sixteen stories high, costing \$1,000,000. One block west is the stately Schiller Building, seventeen stories high, containing the German Theatre, halls, club-rooms and offices. Near it is the new Ashland Block, sixteen stories high, built in classic style. The finest residence streets are Michigan and Drexel Boulevards, Lake Shore Drive, Prairie Avenue and Grand Boulevard.

EDUCATION. — The number of public school buildings is 253, valued at \$15,570,000. In 1895 the number of scholars enrolled was 201,380, with 4,063 teachers. The private

school enrollment was 78,171. The higher educational institutions are the new University of Chicago, opened in 1892, with an endowment of \$7,000,000, \$3,600,000 of which was given by Mr. Rockefeller; the Northwestern University at Evanston; the Chicago (Cong.), McCormick (Presb.), Western (Prot. Epis.), and Baptist theological seminaries; St. Xavier's Academy; and St. Ignatius College. There are eight medical schools, the most prominent of which are the College of Physicians and Surgeons, the Rush, the Homœopathic, and the Bennet; the Union College of Law; five dental colleges; two colleges of pharmacy; two training schools for nurses, and the Chicago Veterinary college. There are eight art schools and thirteen schools of music; two manual training schools, the Armour institute, similar in scope to the Pratt and Drexel institutes, and endowed by its founder with \$1,400,000; and Lewis Institute, a projected technical school endowed with \$1,000,000. The Academy of Sciences and the Historical Society lost their most valuable collections in the great fire. The latter lost 100,000 books, some valuable paintings, and the original draft of the Emancipation Proclamation.

LIBRARIES. — Chicago has three great libraries, and a fourth in store. The Public library, founded in 1862, has the largest circulation of any library in the country, and has occupied quarters in the Court house preceding the completion of a magnificent building on Michigan Avenue, estimated cost, \$1,500,000. The Newberry Library is a reference library containing the finest musical library in the country, and has an endowment of \$3,000,000. The handsome new building, which has cost about \$1,000,000, has a capacity for one million volumes, and will eventually cover the entire square, giving accommodation for three millions of books. The Library of the University of Chicago ranks already second among colleges. A fourth great library, to be erected on the south side is the Crerar, endowed with \$2,500,000. The library of the Chicago Law Institute in the County building is large and valuable.

THEATRES, CLUBS, HOTELS. — There are numerous first-class theatres and places of amusement in Chicago. The leading theatres are the Auditorium, with 7,000 seats; the Alhambra, Moorish in design and one of the most beautiful in the city, with a seating capacity of 2500; the Chicago opera house, capacity 2300; the Columbia, capacity 2400; the German theatre; Grand Opera; Havlin's; Hooley's; the Haymarket, McVickar's, rebuilt in 1891, and the Great Northern, opened in 1896; Jacob's academy of music and Central music hall are used for concerts and lectures. The Libby Prison museum contains the original prison.

The leading clubs are the Athletic, Calumet, Chicago, Illinois, Iroquois, La Salle, Marquette, Standard, Union, Union League, and the Chicago Woman's Club. The Calumet, Standard and Union League have magnificent club houses. There are in Chicago nearly 6000 societies.

There are about 750 hotels. The most prominent are the Auditorium; with a large annex, Congress hall, opened 1893; the Richelieu; Great Northern; Metropole; Granada; Palmer house; Grand Pacific; Hampden; Wellington; Lexington; Virginia; Leland, and the Imperial.

CHURCHES. — There are nearly 700 churches in Chicago. The most prominent architecturally are the Roman Catholic Cathedral of the Holy Name, an ornate Gothic structure; the Jesuit Church, with a very rich and beautiful interior; the Episcopal Cathedral of St. Peter and St. Paul; St. James's; Grace and Trinity; Immanuel Baptist; Second and Third Presbyterian; Plymouth; St. Paul's, Universalist; Centenary, Methodist; Unity, and the Church of the Messiah, Unitarian.

HOSPITALS AND INSTITUTIONS. — The city contains a large number of hospitals, the largest being the Cook County hospital; the Presbyterian; the United States marine hospital, the largest of its kind in the country; St. Luke's and St. Joseph's hospitals; the Women's hospital, and the hospital of the Alexian Brothers. There are many dispensaries, asylums, and homes, day nurseries, reformatories, and relief societies. One of the most interesting charities is the Armour mission, a memorial to Mr. Joseph Armour, including a mission hall, crèche, library, kindergarten, and dispensary.

COMMERCE. — The commerce of Chicago ranks next to that of New York in extent and variety. Chicago is the largest grain port in the world, the capacity of its grain elevators being over 30,075,000 bushels. The grain fleet of 1896 comprised 121 steamers and 69 schooners and barges, of an aggregate capacity of 13,202,000 bushels. It was the largest fleet ever assembled here, and represented a capital investment of over \$20,000,000. The live-stock and lumber interests in their order follow grain in importance. The foreign trade in merchandise in the calendar year 1896 was — imports, \$12,117,115, and exports, \$2,509,124. The city also has an enormous domestic trade by railroad.

MANUFACTURES. — In 1890 the number of manufactories was 9,977 with \$359,739,598 capital, employing 210,366 persons, to whom \$19,885,079 was paid in wages, and with products valued at \$664,567,923. The chief articles manufactured are iron and steel, agricultural implements, railroad cars, textiles, beer and spirits, leather and meat products. Among the great establishments are the *Illinois Steel Company*, with the largest rolling mills in the world, and a capital of \$50,000,000; the *McCormick Harvesting Machine Company*, producing 120,000 machines yearly, and the *Grant Locomotive Works*. Chicago is famous for its stock yards and meat-packing establishments. The Union stock yards cover 400 acres and can accommodate at one time over 200,000 animals. The slaughtering and meat-packing industry was the most important in 1890 in the value of its products. The capital investment was \$39,222,195, and the value of all products was \$203,606,402.

For places outside of territory covered by this map see general map of Chicago.

BANKS.—There were reported in 1895, 21 national banks with a combined capital of \$20,900,000; 9 state banks, capital, \$3,497,000; 10 loan and trust companies, capital, \$8,300,000; 2 branch Canadian banks; and 14 private banks. The exchanges at the U. S. clearing-house in the year ending Sept. 30, 1896, aggregated \$4,538,505,883.

GOVERNMENT, ETC.—The government is vested in a mayor, elected for two years, and a city council of two from each ward. The judiciary consists of the United States Court of Claims; Circuit and District Courts, the Appellate Court of the First District of Illinois; the Circuit, Superior, Probate, Criminal and County Courts of Cook County and ten police courts.

The police force consists of over 3200 officers and men, and costs about \$3,500,000 annually, and the fire department has over 1200 officers and men, and costs about \$1,550,000 per annum. The annual cost of maintaining the public schools is nearly \$7,000,000, and that of the entire city government nearly \$17,000,000. The city tax rate averages \$4.76 per \$100.

WATERWORKS.—Water is supplied from Lake Michigan by means of cribs 2-4 miles from shore, and five tunnels under the lake, leading to separate pumping works on shore. At one there are four double and two single engines, supplying 50,000,000 gallons daily, and at the other four engines supplying 61,000,000 gallons. The total capacity of the entire plant is 354,000,000 gallons; the average daily consumption is 252,000,000 gallons; and the system has over 1600 miles of distributing mains.

FINANCES.—The assessed valuation of property in Chicago in 1895 was \$243,476,825; real estate, \$192,498,842; personal property, \$36,850,200; railroad property, \$14,127,783. The total bonded debt of the city on July 1, 1896, was \$17,078,950; sinking funds, \$1,216,852; net debt, \$15,862,098. The city owned its water works, which cost \$21,888,245, an electric light system, and other property, valued in all at \$53,294,257.

MILITARY.—Chicago is the headquarters of the Military Department of the Missouri, Gen. Wesley Merritt commanding. The militia consists of the First and Second Regiments of the First Brigade of the Illinois National Guard, about 1600 men, Cavalry Troop A, 63 men and a battery of artillery. There are in addition three independent military organizations—the Chicago Hussars, Chicago Zouaves and Chicago Lancers.

POPULATION.—The population in 1837 (first census) was 4170; 1850, 28,269; 1860, 112,172; 1880, 503,188—204,859 foreign born, including 75,208 from Germany, 62,374 from Great Britain and Ireland. By the annexation, 1889, of Lake View, Hyde Park and other suburbs, the population was increased to 1,066,000. Total population 1890, 1,099,850. See *History of Chicago*, by A. S. Andreas (3 vols., 1670-1884, c. 1884); *History of Chicago from 1833-1892*, by C. Clearer (1892); *The Story of Chicago*, by J. Kirkland (1892).

CHICAGO, UNIVERSITY OF, was founded in 1889 when the first subscription was made by John D. Rockefeller. Between that time and 1897 contributions and subscriptions have aggregated \$11,500,000, of which \$7,426,000 have come from Mr. Rockefeller. The University is situated in the south division of Chicago, between Jackson and Washington parks, fronting on the Midway Plaisance. On its grounds, which contain about 24 acres, with the prospect of enlargement at an early date, are 13 buildings costing about \$1,300,000, and at Geneva Lake, Wis., the University owns 55 acres of land on which the Yerkes Observatory stands. The University consists of the graduate schools; divinity school; the colleges; the academy; the University Extension; the University libraries; laboratories; museums; the University Press; and the University affiliations. In the arrangement of the undergraduate work, the University has adopted the new plan of dividing the students into two systems of colleges—the senior colleges, which include the two upper classes of the ordinary college, and the junior colleges, which include the lower classes. The academy is located at Morgan Park, about 8 miles from the University, occupies 10 acres of ground, has four buildings, and an attendance of over 200 students. In the work of extension, the University has made great progress, giving courses of lectures in many cities and villages at a distance. It is estimated that more than 25,000 people attend these lectures each year. The University Press prints the journals, books and pamphlets of the University, including among others, the *Biblical World*, the *Journal of Political Economy*, the *Journal of Geology*, and the *American Journal of Sociology*. The libraries are extensive and annually increasing. The University enters into terms of affiliation with colleges and academies by which it seeks to confer advantages on them, and to receive benefit from them. It has another peculiar feature in that it continues throughout the entire year, which is divided into four quarters of twelve weeks each, with a vacation of one week between quarters. The summer session is attended largely by teachers in high schools and academies, and professors in colleges and universities. The University is co-educational and gives the same advantages to women students as to men. Fellowships and scholarships provide for the gratuitous tuition of two or three hundred students. In 1896-7 the number of students enrolled was 2,000, and the teaching force numbered 180. Professor William Rainey Harper, of Yale, was elected first president of the University and the actual instruction began in the colleges, graduate schools, and divinity school in Oct. 1892.

CHICHESTER, a municipal and parliamentary borough and episcopal city in Sussex, 17½ m. e.n.e. of Portsmouth. It stands on a plain between an arm of the sea and the South Downs, which rise gently on the north. It is well built, and has wide streets. The two main streets cross at right angles, and meet in an elaborately worked eight-sided

cross. Within the suburbs the city is surrounded by an ancient wall, $1\frac{1}{2}$ m. in circuit, with some semicircular bastions, and now a promenade under the shade of elms. The cathedral, erected in the 12th and 13th centuries, on the site of a wooden one founded 1108, and burned 1114, measures 410 by 91 ft., with a spire 271 ft. high. The aisles are double—a mode of construction to be seen nowhere else in Britain. The cathedral has a rich choir, and portraits of the English sovereigns from the conquest to George I., and of the bishops down to the reformation. The chief trade is in agricultural produce, and live-stock. There are malting, brewing, and tanning establishments. Pop. '91, 7,842. C. returns one member to parliament. The harbor, 2 m. to the s.w. of the city, is a deep inlet of the English channel, of about 8 sq. m.; has several creeks and Thorny isle; and is connected with C. by a canal. C. was the Roman *Regnum*, and has afforded Roman remains—as a mosaic pavement, coins, urns, and an inscription of the dedication of a temple to Neptune and Minerva. C. was taken and partly destroyed, in 491, by the South Saxons. It was soon after rebuilt by Cissa, their king, and called Cissan-caster, or Cissa's camp. It was for some time the capital of the kingdom of Sussex. In 1642, the royalists of C. surrendered to the parliamentarians, after a siege of ten days.

CHICKADEE, *Parus atricapillus*, is distinct from the European blackcap. It is about $5\frac{1}{2}$ in. long, and 8 in. in spread of wings. Head and neck, and a patch on the throat, black; other plumage, ash-gray and brown; tail edged with white, and a white bar on the wings. Where it has not been driven away by the English sparrow, it destroys great numbers of canker worms and other caterpillars. It is a very lively, sociable, and useful bird. See *illus.*, LARKS, ETC., vol. VIII. See *TIT*.

CHICKAHOMINY, a river in Virginia, rising n.w. of Richmond and running e. between the James and the Pamunkey to the w. line of James City co., where it turns abruptly s., and after a course of about 10 m., joins the James. The surrounding country e. of Richmond is level, and in one section there is a large swamp. On and near the C. in the early years of the civil war occurred many of the most important military movements, skirmishes, and battles—here mentioned in the order of time. In 1862, the peninsular campaign on the part of the union army began with the siege of Yorktown, the objective point being Richmond, to reach which it was necessary that the C. should be crossed. McClellan, on the union side, had 118,000 men when the siege was begun, April 5. On the other side, the confederates had 15,000 men in Yorktown, and about 50,000 more scattered over n. Virginia, all under Gen. Joseph E. Johnston. The 6th of May was the day for opening fire upon Yorktown, but on the 4th Johnston left the place, taking guns, baggage, etc., and retreated towards Richmond. On the 5th he was assailed by Hooker; and Longstreet, who commanded the rear of the confederates, turned on the defensive just as he had passed Williamsburg. He was met by Hancock's division, and was compelled to abandon his works after a sharp fight; but Longstreet held his position long enough to secure the confederate trains from pursuit. This was the battle of Williamsburg. The union loss was 1856 killed and wounded, and 372 missing. The confederate loss was about the same. On the 27th of May occurred the battle of Hanover Court-House, in which the union loss was 53 killed and 344 wounded and missing. The confederate loss must have been much greater, for McClellan's report says there were about 200 of their dead buried by his troops, and 730 prisoners were sent to the rear. The confederates had now concentrated in and around Richmond, where they had 67,000 men. The next fight on the C. was the battle of the Seven Pines, or of Fair Oaks, which took place on the 31st of May, and resulted in a substantial union victory. The confederate leader, Gen. Johnston, was severely wounded, and their losses were very heavy, but, as in most cases, no trustworthy report was made of the numbers. The union army lost 890 killed, 3,627 wounded, and 1222 missing. It is well known that the confederates felt this to be a disastrous defeat, and in common with the people of the northern states, they expected that the next move would be the capture of Richmond; but, for reasons concerning which it is to be said only that they were never explained to the general satisfaction of the people in the northern states, McClellan made no demonstration, and soon the almost defenseless city was powerfully fortified under the direction of Gen. Robert E. Lee, who had superseded Johnston in the confederate command. The fourth of the contests of the C. was the battle of Mechanicsville, June 26, and was not important in results. The confederates made several attacks upon two union brigades, but finally abandoned the work after losing about 1500 men; federal loss, 300. A more important action which occurred June 27, is known as the battle of Cold Harbor, or Gaines' Mill; the confederates call it the battle of the Chickahominy. Their loss was about 9,500; the union loss, 4,000 killed and wounded, and 2,000 prisoners. The sixth conflict in the neighborhood of the C. is known as the battle of Savage's Station, June 30, and was not an important affair. The losses were: union, 600; confederate reported at 400. The next was the battle of Frazier's Farm, also June 30, in which there was some sharp fighting, resulting in a union loss of 300 killed and 1500 wounded; and on the other side, 325 killed and 1700 wounded. The battle of Malvern Hill occurred July 1, and involved a union loss of 375 killed and 1800 wounded; and of confederates, 900 killed and 3,500 wounded. All these engagements from June 26 to July 1 cost the federals 1582 killed and 7,709 wounded; and the confederates 3,150 killed and 15,255 wounded. Including prisoners and missing, the totals of loss were:

union, 15,429; confederate, 19,405. The object, on the part of the confederates, was to relieve Richmond from the threatened siege and capture; and they succeeded. Near the end of the summer the union armies were withdrawn and combined to form the army of the Potomac. But nearly two years later there occurred one more (the second) battle of Cold Harbor, when Grant had command. The fight took place June 3, 1864, and was substantially a check of the union advance. The federal losses were about 7,000 in all; the losses on the other side were said to be only half as many. It was a little before this that Grant sent to Washington the dispatch: "I propose to fight it out on this line if it takes all summer."

CHICKAMAUGA, BATTLE OF, Sept. 19-20, 1863, between the union army of the Cumberland, led by Gen. Rosecranz, and the confederate forces led by Gens. Bragg and Longstreet. The forces on the union side numbered about 55,000, a quarter of whom were not engaged; the losses were 1644 killed, 9,262 wounded, and 4,948 prisoners; total, 15,854. The confederate reports embrace but two thirds of their army, and show 1394 killed, 8,974 wounded, and 882 missing; total, 11,250. A few days after the battle Gen. Rosecranz was relieved, and Gen. Grant placed in command. The battle was credited as a victory for the confederates, though no substantial advantage was gained by them. The battlefield has been converted into a National Military Park.

CHICKAREE, a popular name for the red squirrel, *sciurus Hudsonius*. It abounds in the southern and middle Atlantic states, and is esteemed for the tenderness and flavor of its flesh. It is not so gentle or so easily tamed as the gray squirrel.

CHICKASAW, a co. in n.e. Iowa, on the Wapsipinicon river and its tributaries, reached by the Chicago, Milwaukee, and St. Paul, and the Illinois Central railroads; 504 sq. m.; pop. '90, 15,019. The surface is prairie and woodland, and the soil fertile; agriculture is the chief business. Co. seat, New Hampton.

CHICKASAW, a co. in n.e. Mississippi, on the head waters and tributaries of the Tombigbee river, and touched by the Mobile and Ohio railroad; 520 sq.m.; pop. '90, 19,891, inclu. colored. The county is a part of the territory ceded by the Chickasaw Indians. It has a level surface and fertile soil, producing corn, cotton, etc. Co. seat, Houston.

CHICKASAW BLUFFS, BATTLE OF, Dec. 29, 1862. The siege of Vicksburg being in progress, Gen. Sherman (union) was ordered to make an attack in the rear, and for that purpose sent a force up Yazoo river to land above the city and approach it from the north. In this march they came upon a bayou held by a confederate force strongly entrenched. Several attempts were made to force a passage, but without success. The union loss was 192 killed, and 982 wounded. That of the other side was very small.

CHICKASAWS, a nation of Indians occupying a section of the Indian territory, embracing 7,267 sq.m. on the left bank of the Red River. According to their traditions and the evidence of philology, they are closely connected with the Creeks and Choctaws; and they believe that they emigrated with those tribes from the west, crossed the Mississippi, and settled in the district now forming the n.e. part of the state of Mississippi. Here De Soto visited them in 1540. From the first they were hostile to the French, and were frequently at war with them; but with the English they were generally friendly. In 1786, they made a treaty with the United States, and in 1793, they aided the whites in the war against the Creek Indians. In the early years of the present century, part of their territory was ceded for certain annuities, and a portion of the tribe migrated to Arkansas; and in 1832-34, the remainder, about 3,600 in number, surrendered to the federal government the 6,642,000 acres of which they were still the owners, and entered into a treaty with the Choctaws for incorporation into that tribe. This union was afterwards dissolved and by paying the Choctaws \$150,000 they secured full possession of their present territory. In the civil war they assisted the confederates, but their rights were restored by the Union government in 1866. The next year they surrendered 7,000,000 acres of land at 4½ cents per acre, the money (\$300,000) to go to their late slaves, unless, within two years, they adopted them as members of the tribe. In Jan., 1873, they concluded to adopt the negroes. The nation has a printed constitution prefaced by a declaration of rights, which asserts that all political power inheres in the people; that all men should be free to worship God according to the dictates of their conscience, and not be compelled to attend, erect, or support any religious ministry against their consent; that there should be freedom of speech; that there should be security from unreasonable searches of property or person; that every person accused of crime should have a speedy trial. All free males 19 years old or over who are Chickasaws by birth or adoption, may vote, unless idiotic, insane, or convicted of infamous crime. There are a senate and house of representatives, the latter of 18 members elected annually by the voters of the counties or districts. A representative must be 21 years old. There are 12 senators elected for two years from the four districts of the state. A senator must be 30 years old, a Chickasaw by birth or adoption, and a resident of his district six months. The governor must have all the qualifications of a senator; he is chosen for two years by popular vote, and has about the same powers and functions as a governor of one of the states. There is a supreme court consisting of a chief and two assistant justices elected to the legislature for four years. There are also circuit and county courts. The

nation has in the custody of the federal government \$1,200,000 in bonds on which interest is paid. In 1890, the number of Chickasaws was only 3464. The reservation contains fine farming lands.

CHICKEN-POX, a contagious febrile disease, chiefly of children, and bearing some resemblance to a very mild form of small-pox (q.v.). C. is distinguished by an eruption of vesicles or blebs, which rarely become pustular or yellow, and leave only a very slight incrustation, which falls off in a few days, without any permanent mark or pit, as in small-pox. From its vesicular character, it has been called the *crystal pox*. It has been argued that C. is, in fact, only small-pox modified by previous vaccination; but this opinion, though maintained on good authority, is not generally received by medical men. It is a disease of little or no danger, the fever being often hardly perceptible, and never lasting long.

CHICKEN SNAKE, or MILK SNAKE, *Ophibolus eximius*, a harmless individual of the serpent tribe, frequenting houses, stables, and dairies. It is sometimes 5 ft. long, though usually much less; the color is milky white above, sometimes tinged with red, with dusky spots along the vertebral line and smaller spots along the sides, the abdomen silver white or yellowish. It feeds on insects, mice, toads, frogs, and small birds.

CHICKERING, JONAS, 1797-1853; a self taught piano-maker of Boston, who succeeded in establishing the largest piano-manufactory in the country, at times producing at the rate of 1,500 instruments in a year.

CHICK PEA (*Cicer*), a genus of plants of the natural order *Leguminosæ*, sub-order *Papilionaceæ*, having pinnate leaves; solitary, axillary, stalked flowers; and two-seeded pods, inflated like bladders. The common C. P. (*C. arictinum*) grows wild in the corn-fields of the countries around the Mediterranean sea, and in many parts of the east. It is an annual, 1½ to 2 ft. high, of a stiff upright habit, covered with glandular hairs. The seeds abound in farina, and have a slightly bitterish taste. They are about the size of common peas, curiously wrinkled, so that they have been thought to resemble a ram's (*arictis*) head. They are used as food, either boiled or roasted, and are the most common *parched pulse* of the east. They are an important article of French cookery. They have been in general use from the earliest times.

CHICKWEED, *Stellaria media*, one of the most common weeds of gardens and cultivated fields, is a species of stitchwort (q.v.). It is a native of most parts of Europe and of Asia, appearing during the colder months even on the plains of India; an annual, with a weak procumbent stem and ovate leaves, very variable; some of the smaller varieties in dry sunny situations sometimes puzzling young botanists, from having only five or three instead of ten stamens; but always characterized by having the stem curiously marked with a line of hairs, which at each pair of leaves changes from one side to another, and in four changes completes the circuit of the stem. The leaves of C. afford a fine instance of the *sleep of plants*, closing up on the young shoots at night. C. is a good substitute for spinach or greens, although generally little regarded except as a troublesome weed, or gathered only by the poor to make poultices, for which it is very useful, or for feeding cage-birds, which are very fond both of its leaves and seeds. A number of species of a nearly allied genus, *cerastium*, natives of Europe, also bear the name of C., or MOUSE-EAR C., and the name is occasionally given to other plants, either botanically allied, or of somewhat similar appearance, as *holosternum umbellatum*, common in parts of Pennsylvania and New Jersey, and called JAGGED CHICKWEED.

CHICLANA, a t. of Andalusia, Spain, about 12 m. s.e. of Cadiz. It is pleasantly situated on a plain between two hills, and its houses being all built of white stone, present a cheerful appearance. It has a splendid hospital. The manufactures are linen, earthenware, and brandy. Its mineral baths are much frequented by the inhabitants of Cadiz. Pop. variously estimated, but probably about 12,300.

CHICOPEE, a city of Hampden co., Mass., on the e. side of the Connecticut River, at the mouth of Chicopee River, 3 miles n. of Springfield, with which and Holyoke it is connected by electric street railroads, as well as by the Connecticut River railroad. Settled about 1640, it was incorporated as a town in 1848, and was chartered as a city in 1890. It contains the villages of Chicopee Falls, Fairview, and Williamansett. Chicopee Falls supplies abundant water power for various manufactures, by means of several dams. The city is noted for the extent and variety of its manufactures, which include cotton cloth, blankets, bicycles, military equipments, knitting machines, agricultural implements, bronze statuary, brass goods, machine and mechanics' tools. There are many churches, a high, and excellent graded schools, a town hall built at cost of \$100,000, a free public library, and national and savings banks. Population, 1870, 9607; 1880, 11,286; 1890, 14,050.

CHICORY, or SUCCORY (*cichorium*), a genus of plants of the natural order *compositæ*, sub-order *Cichoraceæ*, distinguished by bracts in two unequal rows, the outer always reflexed, the inner latterly becoming so, a nearly naked receptacle, obovate striated achenia, and a pappus of two rows of minute scales. The species are few in number, herbaceous plants, full of milky juice, natives chiefly of the warmer temperate regions of the eastern hemisphere. The common C. or SUCCORY (*C. intybus*) is a perennial plant, found wild in England and most parts of Europe, growing in waysides, borders

of fields, etc. It has a long carrot-like root, externally of a dirty or brownish yellow color, and white within. The stem rises to the height of 2 to 5 ft., branching, the leaves are *runcinate*, resembling those of the dandelion; the flowers sessile, axillary, in pairs, rather large, beautiful, generally blue, more rarely pink or white. C. is pretty extensively cultivated, both in England and on the continent of Europe, for its roots. It is also cultivated for feeding cattle with its leaves. The blanched leaves are sometimes used as a salad, and they are readily procured in winter by placing the roots in a box with a little earth in a cellar.—To this genus belongs also the endive (q. v.).

C. has been used as a substitute for coffee, or to mix with coffee, for at least a century. The roots are pulled up, washed, cut into small pieces, and dried on a kiln, which leaves a shriveled mass not more than one fourth the weight of the original root. It is then roasted in heated iron cylinders, which are kept revolving as in coffee-roasting, during which it loses about 25 to 30 per cent of its weight, and evolves at the same time a disagreeable odor, resembling burned gingerbread. An improvement to the C. during roasting is the addition of 2 lbs. of lard or butter for every cwt. of C., which communicates to it much of the luster and general appearance of coffee. It is then hand-picked, to remove chips of wood, stones, etc., and is reduced to powder, and sold separately as *C. powder* or *C. coffee*, or is added to ordinary ground-coffee, and is sold as a mixture. C. contains a good deal of sugar, but otherwise does not serve to supply the animal economy with any useful ingredient. It gives off a deep brown color to water, when an infusion is made, and hence its main use in coffee. Some people dislike the taste of C., and when largely used, it has a tendency to produce diarrhea; but many people prefer to use coffee mixed with C. owing partly to the taste it communicates, but mainly to the appearance of strength which it gives to the coffee. The C. is liable to adulteration; and roasted beans, pease, carrots, parsnips, mangold-wurzel, acorns, horse-chestnuts, biscuit, oak-bark tan, logwood and mahogany dust, and even the livers of horses and bullocks, are said to be employed in its adulteration.

CHICOT, a co. in s.e. Arkansas, on the Louisiana border and the Mississippi river, intersected by Crooked and Mason's bayous; 760 sq.m.; pop. '90, 11,419, incl. colored. The surface is level, and in some parts is subjected to inundations; chief productions, corn and cotton. Co. seat, Lake Village.

CHICOUTIMI, a n.e. co. of Quebec, Canada, having the ridge of land dividing the waters of the St. Lawrence and Hudson bay as its n. boundary, and the 48th parallel of latitude as its s. boundary. It is drained by Lake St. John and by a number of large rivers, including the Saguenay and the Chicoutimi. Co. seat, Chicoutimi. The counties of Chicoutimi and Saguenay form an electoral district, with pop. '91, 38,281.

CHIEF, in heraldry, an ordinary formed by a horizontal line, and occupying the upper part of the escutcheon. Like the other honorable ordinaries, the C. ought properly to take up a third part of the shield; but when the other charges are numerous, the C. is frequently diminished in size.—Any object borne in the upper or chief part of the shield is said to be *in chief*, though the C. be not divided off from the rest of the field, as a separate portion.—*On a chief*: Is when the object is represented on the C., divided off as above described.

CHIEF-JUSTICE, the presiding justice of the supreme court of the United States, and of the courts of highest jurisdiction in most of the several states. The chief-justice of the United States administers the oath on the occasion of the inauguration of the president and vice-president; he presides when an impeached president is tried, and has the nomination of certain judicial officers.

CHIEF-JUSTICE. See COURT OF SESSION; JUDICIARY; JUSTICE, LORD CHIEF; JUSTICE-CLERK; JUSTICE GENERAL.

CHIEM-SEE, a lake of Upper Bavaria, the largest in the country, lies about 42 m. s.e. of Munich. It is situated at an elevation of more than 1600 fr. above the sea; its length is 12 m., with a breadth of 9, and its greatest depth 500 feet. Its shape is irregular, and its coast much indented. It has three islands; the Achen and Prien flow into it, and its surplus water is discharged by the Alz into the Inn. The C. is famous for its fish; and a small steamer which plies on it, enables travelers to view its fine scenery.

CHIE'RI, a t. of Piedmont, northern Italy, situated on the slope of a hill 9 m. s.e. of Turin. C. is an ancient place. By the later Romans it was called Carea. The church of St. Dominico, built in 1260, has some good paintings; and that of Santa Maria della Scala, built in 1405, is one of the largest Gothic structures in Piedmont. C. is one of oldest manufacturing towns in Europe, its manufacture of fustians and cotton stuffs dating from 1422. Silk, cotton, and linen are still important manufactures. Pop. 15,000.

CHIE'TI (Province). See ABRUZZO.

CHIE'TI, an archiepiscopal city of Italy, capital of the province of the same name, is situated on a hill near the Pescara, about 100 m. n. of Naples. It is a well-built and flourishing place, with some imposing public edifices, including a cathedral, lyceum, and theater; and its agreeable situation has made it the residence of numerous wealthy families. The district around is fertile and well cultivated, and in the city the cloth and silk manufactures are extensive. Pop. '94, 22,800.

CHIGNEC TO BAY, the more westerly of the two inlets at the head or n. end of the bay of Fundy, in British North America. It separates Nova Scotia from New Brunswick, is 30 m. long and 8 broad, and has an isthmus of only 14 m. in width between it and Northumberland strait, in the gulf of St. Lawrence.

CHIGOE, or *JIG'GER*, *Pulex*, or *Sarcopsylla penetrans*, a species of flea (q.v.), rather smaller than the common flea, and with less powerful limbs, found in the West Indies and South America, where it is excessively troublesome, attacking any exposed part of the human body, and affecting a lodgment between the skin and flesh, often under the skin of the foot or the nails of the toes. At first, its presence is indicated only by a slight itching or tingling; but an ulceration is likely soon to be the result, which is not only very painful, but even dangerous.

CHIGNON (Fr., originally "the nape of the neck"), a general term for the long back hair of women when gathered up and folded into a roll on the back of the head and neck. It was a common mode of wearing the hair in the eighteenth century, the hair being often padded and powdered. In 1866 the chignon reappeared, but through the frequent addition of false hair it attained such ungraceful proportions that in 1875 it again fell into disuse.

CHIHUAHUA, a city of the Mexican confederation, with a considerable trade between Santa Fé, in New Mexico, and the United States. Pop. 1892, about 25,000. It is in lat. 28° 40' n., and long. 105° 33' w., and has a cathedral, and an aqueduct three m. long, besides appropriate buildings, as the capital of the state of its own name. The territory in question, stretching in lat. from 27° to 32° n., and in long. from 104° to 108° 40' w., is divided from Texas, in the United States, by the Rio Bravo del Norte. It is a tableland, more remarkable for mineral resources than for agricultural productions. It abounds in niter and other salts, and in mines of gold and silver. Pop. '95, 266,831.

CHILBLAINS. See CHAPPED HANDS.

CHILD, FRANCIS JAMES, PH.D., LL.D., the most learned of ballad editors, was born in Cambridge, Mass., Feb. 1, 1825. He graduated at Harvard in 1846, and was an instructor there for some time in the department of mathematics, and afterwards in that of rhetoric. In 1849 he went to Europe, where he remained about two years. In 1851 he was appointed to the chair of rhetoric at Harvard, which he exchanged in 1876 for that of Anglo-Saxon and Early English literature. His first work was *Four Old Plays* (1848); but more important were his annotated editions of *Spenser* (5 vols., Boston, 1855), and his first collection of the *English and Scotch Ballads* (8 vols., Boston, 1857-59). The latter was at once recognized as the best collection of English ballad poetry. Professor Child then engaged upon a great comparative collection of ballads, *The English and Scottish Ballads*, of which eight parts were issued between 1882 and 1892. This may be accepted as the final work on its subject, as it contains all the versions and variants collected from all sources, while the introductions to each ballad are masterpieces of clearness and learning. Professor Child also contributed some valuable notes to Hale's and Furnivall's reprint of Bishop Percy's folio manuscript (1867-68); also the article on *Ballad Poetry* in Johnson's Encyclopedia. His invaluable *Observations on the Language of Chaucer and Gower*, forming two papers in the *Memoirs of the American Academy*, and reprinted in part I. of Ellis's *Early English Pronunciation* (1869), reveal a marvellously intimate knowledge of Middle English grammar. He d. in 1896.

CHILD, Sir JOSIAH, an eminent London merchant, and one of the popular English writers on commerce and political economy, b. in 1630, was the second son of Richard Child, a merchant of London. His principal work is entitled *Brief Observations concerning Trade and the Interest of Money* (Lond. 1668, 4to); a 2d edition, much enlarged, entitled *A New Discourse of Trade*, was published in 1690. In this work he explains his plans for the relief and employment of the poor, including the substitution of districts or unions for parishes, and the compulsory transportation of paupers to the colonies. He was one of the directors, and for some time chairman of the East India company, and is said to have written several tracts in defence of the trade to the East Indies, which were published anonymously. In 1678 he was created a baronet, and died in 1699.

CHILD, LYDIA MARIA, 1802-80; b. Mass. When 22 years of age she published *Hobomok, an Indian Story*, and a year afterwards *The Rebels, a Tale of the Revolution*, in which she gave a speech by James Otis, and a sermon by Whitfield, both long believed to have been made by the men themselves. For eight years she was the editor of *The Juvenile Miscellany*, a monthly magazine for the young. Among her earlier works are: *The American Frugal Housewife*; *The Girl's Own Book*; and *The Mother's Book*. She was among the first of the New England anti-slavery writers, beginning with *Appeal in behalf of that Class of Americans called Africans*; and in 1841 she became one of the editors of the *National Anti-Slavery Standard*, in which paper she published her popular *Letters from New York*. Subsequently she published *History of the Condition of Women in all Ages and Nations*; *Biographies of Good Wives*; *Life of Isaac T. Hopper*; *Progress of Religious Ideas*; *Autumnal Leaves*; *Looking towards Sunset*; *The Freedman's Book*; *A Romance of the Republic*, etc.

CHILDERMAS or **HOLY INNOCENTS' DAY** (28th Dec.), is observed by the church of Rome with masses for the children killed by Herod. It was considered unlucky to marry or to begin any work on this day. The learned Gregory says: "It hath been a custom and yet is elsewhere, to whip up the children upon Innocents' day morning, that the memory of Herod's murder might stick the closer" It is also a holiday in the church of England.

CHILDERS, **HUGH CULLING EARDLEY**, b. London, 1827; successively sec. of state, chancellor, exchequer, home sec., in Gladstone's cabinets, 1880-86. He graduated from Trinity coll., Cambridge. Emigrating to Australia he there made a study of politics. He was appointed commissioner of trade and customs in the Australian cabinet. He returned to England, 1857, and stood as the liberal candidate for Pontefract, gaining the seat after some legal opposition. C. became a lord of the admiralty, 1864, and financial secretary of the treasury, 1865. In 1872 he re-entered the ministry as chancellor of the duchy of Lancaster. C. wrote in behalf of free trade and national education, and was a fellow of the Royal society. He d. in 1896.

CHILDREN, **SOCIETIES FOR THE PREVENTION OF CRUELTY TO**. Organizations now exist in many of the states having for their object the proper protection of children against the cruelty of parents and guardians, as well as against the illegal demands of corporations and employers. Bills have been passed in the state legislatures, often largely through the influence of these societies, limiting the age of minors employed by manufacturers, and also the working hours of children and women in mills and factories. In Mass. children under 14 years of age are forbidden employment in manufacturing, mechanical, and mercantile establishments, while the public schools are in session, unless they can read and write. In N. H., an act has been passed prohibiting the employment of children under 10 years of age. In Mich., the employment of children under 10 years of age by showmen, the giving of obscene books, pamphlets, etc., to minors, and the exhibition of the same in view of passing children, are prohibited. In N. Y., by a bill passed in 1885, ten hours are made the limit of daily work in factories for minors and women; and children under 12 years of age, unable to write, are prohibited employment. All these and similar laws, the societies for the prevention of cruelty to children are authorized to see enforced; and in the performance of their work they may call upon magistrates and officers of police for aid.

CHILDREN, **JOHN GEORGE**, 1777-1852; an English scientist who traveled in the United States, devoting his attention chiefly to electricity and galvanism. Among his papers, are those discussing the conversion of iron into steel by union with diamond, and a method of extracting silver from the ore without amalgamation. He translated Berzelius on the blow-pipe, and Thenard on chemical analysis. He was for some years secretary of the royal society.

CHILDREN'S AID SOCIETIES, first established in New York city, chiefly by the exertions of Charles L. Brace, about the year 1853. The object of this and its many imitative societies is to care for the poor and neglected children of large cities, to rescue them from want and crime, afford rudimentary education, and provide homes for them, usually among the farmers of the agricultural states.

CHILDRESS, a co. in Texas, bordering Indian Terr. on n.; formed 1876; drained by Red river; 750 sq. m. Pop. '90, 1175. Co. seat, Childress.

CHILDS, **GEORGE WILLIAM**, LL.D., philanthropist, was b. at Baltimore, Md., in 1829; entered the navy at the age of thirteen, and spent fifteen months in the service. He then became a clerk in a bookstore in Philadelphia; at the age of eighteen established an independent business, and in 1849 became a partner in the publishing house of Childs and Peterson. In 1864 he purchased the *Public Ledger*, one of the earliest cheap newspapers of the country, which under him attained a wide circulation and influence. His public gifts were munificent, including a memorial window in Westminster Abbey to Cowper and George Herbert; one in St. Margaret's, Westminster, to Milton; a reredos in St. Thomas's, Winchester, commemorating Bishops Ken and Andrews; a monument at Kensal Green to Leigh Hunt; a memorial fountain at Stratford-on-Avon; and, in his own country, the presentation to the Typographical Society of Philadelphia of the printers' cemetery, "Woodlands," in that city; the erection of monuments over the graves of Edgar A. Poe and Prof. Richard A. Proctor; the erection of a stone cross on the site of the first Christian service on the California coast at Point Reyes, and a subscription that made possible the erection and endowment of the Home for Union Printers at Colorado Springs, Col. In 1885 he published *Recollections of General Grant*, and in 1889 a volume of *Personal Recollections*. He d. in 1894.

CHILE (or **CHILI**), a South American republic, on the Pacific coast, extends from about lat. 18° to 55° 58' 40" s. (Cape Horn), and is bounded on the north by Peru, and on the east by Bolivia and the Argentine Republic. Its length, including Terra del Fuego, is nearly 2500 miles; its breadth varies from 40 to 200 miles; its area is about 294,000 square miles. In 1881, Patagonia west of the Andes, with the greater part of Terra del Fuego, was acquired by treaty with the Argentine Republic, and as a result of the war of 1879-83, Chile, in 1883, annexed the Bolivian territory of Antofagasta, and the Peruvian department of Tarapacá. The Peruvian territories of Tacna and Arica

were to remain subject to Chile until a popular vote should decide the question of ownership. The vote should have been taken in 1894, but was postponed.

History. Chile is said to derive its name from an ancient Peruvian word signifying "snow." Originally occupied by Indian tribes, prominent among whom were the Araucanians, it was in great part conquered by the Peruvian incas, and was held by them during the period 1433-1533. The Spaniards, after obtaining possession of Peru, invaded Chile (1534) headed by Almagro, a companion of Pizarro, and although repulsed, made a second entry (1540) under Valdivia, who founded the cities of Santiago and Valdivia. The conquerors held the country with difficulty, and conflicts with the Araucanians continued until 1722, when a treaty of peace was made, and the river Biobio became the boundary between the races. The governors of Chile were appointed by the viceroys of Peru up to 1810, when the people declared their independence, and appointed a triumvirate. The Peruvian army was twice defeated by the republican troops, but Chile was finally forced to submit to Spanish rule for three years, when, aided by forces from Buenos Ayres, the patriots gained another victory, at Chacabuco, Feb. 12, 1817, and a decisive one on the plains of Maypu, Apr. 5, 1818. From 1817 to 1823, the government was administered by a dictator, Don Bernardo O'Higgins, a native of Chile, who had been prominent in the rebellion. Other dictators followed, and other triumvirates, but the Spanish troops continued to harass the country till 1826, and internal dissensions occurred until 1847, although the present constitution, promulgated in 1833, had a beneficial effect in the field of politics. A dispute with the Argentine Republic over the possession of Patagonia arose in 1843, and was not definitely settled until 1885, when Chile renounced all claims to the eastern part of that country. A controversy with Bolivia over some ceded territory and the taxation of resident Chileans, led to the invasion of Bolivia, which was followed by an alliance between Bolivia and Peru and a declaration of war against Chile (Apr., 1879). After a severe conflict, during which Lima and Callao were captured, and also the Peruvian war-ships, a treaty was concluded, Oct. 30, 1883, by which Chile secured additional territory, as stated above. In Jan., 1891, a rebellion broke out, the outcome of a long-standing disagreement between the Chilean congress and President Balmaceda, who had, it was asserted, assumed dictatorial powers and violated the constitution. The navy and part of the army joined in the revolt; the ports were besieged by the fleet, the province of Tarapacá was captured by the insurgents, and severe battles occurred on land and sea. Bolivia, alone, recognized the insurgents; ceding Antofagasta to them in perpetuity, in return for the cancellation of old war-debts, and for permission to import merchandise free of duty by way of that port. On July 27, 1891, the insurgents won a decisive victory and captured Valparaiso, and Balmaceda soon after committed suicide, after which order was restored.

Topography. From the northern part of Chile to lat. 41°, the Andes form two parallel chains with a mean elevation of 11,830 feet, enclosing a table-land or broad valley. The eastern range attains, in the volcanoes of Aconcagua and Tupungato, heights of 23,000 and 20,269 feet respectively; the western, or coast range, is lower. The single chain, which constitutes the Patagonian Andes, has a comparatively low elevation, mount Stokes, in lat. 50° 30' s., the highest peak, being only 6400 feet high. Glaciers descend from these Patagonian mountains, and the coast is indented by numerous inlets of great depth. There are twenty-three volcanoes in Chile, some of which are occasionally active. A number of passes cross the Andes, one of which, Doña Ana, has an altitude of 14,770 feet, but during the winter months they are closed to travel. The rivers, which are largely dependent on the melting of the mountain snows, are of inconsiderable size north of lat. 34°. The largest and longest (220 miles), the Biobo, on which the city of Concepcion stands, is navigable for barges and small steamers for 100 miles. Southern Chile contains a number of lakes, and mineral springs are found throughout the country. Of the islands belonging to Chile, the most important are those forming the province of Chilöe (q.v.), and the most celebrated is that of Juan Fernandez. Of the few good harbors, that of Valparaiso is the most important for its commerce, but Talcahuana and Coquimbo are better protected.

Geology. The predominant rocks of Chile are crystalline and metamorphic. They form the range of the Andes, except in those districts in which active volcanoes exist, where they are covered with recent volcanic rocks. They occupy also the whole of the level ground between the mountain-range and the shores of the Pacific, with the exception of a narrow stretch of paleozoic fossiliferous strata which run along the coast south from Santiago for a distance of 300 miles. The coast-line of Chile is being continually altered from the elevation of the whole country to an extent of at least 1200 miles along the Pacific shores, produced by volcanic agency. In 1822, the coast was raised four feet at Quintero, and three feet at Valparaiso, a change of level that was permanent over an area of 100,000 square miles. A similar extensive elevation was noticed in 1835 by Capt. Fitzroy.

Minerals. Chile has great mineral resources including mercury, iron, zinc, manganese, coal, nickel, antimony, arsenic, bismuth, and sulphur. In what is called the mineral belt there are rich mines of gold, silver, and copper. The nitrate fields are of immense value and constitute the main source of the country's revenue. The industry has been largely developed through British capital. The mineral resources of the country have not been fully developed, but rapid progress has been made in recent years.

Fauna and Flora. As enumerated by the naturalist Gay, there are seven species of cheiroptera; twelve of carnivora, including the puma, wildcat, fox, polecat and otter;

six of *phocidæ*; one marsupial; twenty-five of rodents, including the chinchilla; two of *edentata*; three ruminants: the guanaco, and two kinds of deer. There are two species of whale and two of dolphin, and eleven species of reptiles, all harmless, besides scorpions, large spiders, ants, and upwards of 4000 species of beetles. Among the birds and water-fowl are the condor, turkey-buzzard, hawk, owl, crane, black-headed swan, flamingo, paroquet, partridge, woodpecker, and pelican. The shad, perch, and other fishes are caught in great abundance, the *chonos*, a small kind of oyster, and mussels, and clams are found all along the coast. Horses, asses, and mules, are the beasts of burden, and are raised in large numbers, as are cattle. The smaller domestic animals are of inferior breed. Bee-keeping is a profitable industry.

Chile has more than 100 different kinds of indigenous trees, very few of which are deciduous. The provinces of Arauco, Valdivia and Chiloe have the most luxuriant growth. Of special commercial value are the roble, or oak, the Chilean cedar (*Fitzroya patagonica*), the Araucanian pine, attaining, like the last mentioned, a height of 150 feet and over; the lingue, used for making furniture and tanning, and two species of cypress. The coligue, a kind of bamboo, is used for thatching roofs and for the shafts of Indian lances. Vegetation is particularly abundant in the south of Chile.

Climate, Soil, and Agriculture. Between the extremes of Atacama, which receives little or no moisture, and Patagonia, where the rainfall is excessive, the country has an equable and delightful climate, affording clear days and brilliant nights. December, January, and February constitute the Chilean summer. The mercury during that period sometimes registers 95°, but there is usually a sea breeze from ten o'clock to three, and the nights are always cool. Rains fall with more or less frequency from May to Oct., and vegetation is correspondingly luxuriant. The prevailing winds are from the south, but during June, July, and August, *temporales*, or violent northerly winds, occur. At Valdivia the mean summer temperature is 60°; that of winter 46.8°; at Valparaiso, the mean annual temperature is 58°, and at Santiago, 55°. Hurricanes occur at some seasons, and earthquake shocks are frequent, but not more than sixteen of great severity have been recorded, those of 1570 and 1647 having caused the greatest loss of life.

The large extent of rocky mountain land and desert leaves but little space for agricultural products, but the soil is rich. In the northern saline pampas, extending from Peru and Bolivia to Copiapó, agriculture is only temporarily possible. The most productive region is that of the Huasco valley, and in the central part of the country, which was the older Chile. Altogether about 1½ millions of the population are engaged in agriculture. The chief products are Indian corn, wheat, barley, oats, beans, beet-root, tobacco, fruits and silk. The Pacific states are annually supplied with large quantities of Chilean flour. The productiveness of Chilean agriculture is remarkable in view of the primitive methods employed in farming. The annual production of wheat is estimated at about 28,500,000 bushels and other cereals at 8,500,000 bushels. The southern part of Chile produces a large amount of good timber. Stock-raising is carried on extensively. Besides cattle, large numbers of horses, mules, sheep and goats are reared.

Industries, Commerce, etc. The most important occupations of the people outside of agriculture are those connected with mining, and the great industrial centers are to be found chiefly around the Arauco coal region. But there are manufactures of glass-ware, woollens, linens, paper, earthenware, leather, soap, sugar, brandy, together with sugar refineries, gas-works, breweries, carriage and cart works, saw-mills, machine-shops, and mineral water factories. The leading articles of export are nitrate, and other mineral substances; wheat and other agricultural produce. Of these the nitrate and other mineral substances are by far the most important, the exports of nitrate in 1894 being 44,727,513 pesos out of a total of 72,040,420. The most important items in the list of imports are food substances, raw materials, machinery, and textiles. The chief countries outside of South America enjoying trade with Chile, in the order of their importance, were, in the years 1893-94, Great Britain, Germany, France and the United States. On Jan. 1, 1895, the commercial marine consisted of 188 vessels with a total tonnage of 105,642. English, German and French lines of steamers pass from Chile to Europe through the Straits of Magellan, and English and Chilean lines connect Chile with Peru and Panama. Chile took the lead among the South American countries in the construction of railways. The total length of lines open for traffic in 1894 was 1782 miles, of which 686 belonged to the state. In 1895 the length of the lines in process of construction was 436 miles, including the Trans-Andine line from Santa Rosa to Mendoza. In 1894 the country contained 584 post-offices, and there were transmitted through the mails 22,249,296 letters; 2,092,672 circulars, etc., and 28,537,020 newspapers and other printed matter. The state telegraph lines at the end of 1894 had a total length of 6965 miles with 8330 miles of wire.

Religion and Education.—The Roman Catholic religion is supported by the state, which nominates and pays an archbishop and three bishops. The clergy are also paid by the state, and extensive subsidies are granted for building purposes. According to the constitution all other religions are tolerated. Civil marriage is the only form acknowledged by law. Education is gratuitous and compulsory, but the extent of illiteracy is still very great. The instruction is divided into three grades: superior, secondary, and primary. Professional and secondary instruction is provided in the University, the National Institute of Santiago, and in the lycæums and colleges established in the

provinces. The principal institution for secondary education is the National Institute at Santiago, which was founded in 1813. The faculties of the University include law, physical and mathematical sciences, medicine, and the fine arts; and the number of students enrolled for the study of these branches in 1894 was 1190. In the National Institute and the provincial colleges, 8710 students were enrolled in 1895. The government maintains lycées for girls at Santiago. In addition to these institutions there are normal and agricultural schools, and schools for special training, together with theological seminaries at the seats of the bishops, Pædagogic Institute, the National Conservatory of Music, the National Observatory, School of Arts and Trades, Institute of Deaf Mutes, and public museums. The public primary schools in 1895 numbered 1248, with 114,565 pupils and 2145 teachers. There are besides, 411 private schools, with an attendance of 18,052. The National Library contains a large number of volumes of printed books as well as of manuscripts. The census of 1885 made a very unfavorable showing in regard to illiteracy. There were only 634,627 people out of the entire population who could both read and write, and there were 96,636 who could only read.

Government.—Santiago is the capital. The constitution of 1833, still in force, is based upon that of the United States. Every citizen 21 years of age, and able to read and write, is entitled to a vote. The President is elected by delegates chosen by ballot of the full electorate. His salary is fixed at 18,000 pesos, and 12,000 pesos for expenses. After his term has expired he is not eligible for re-election. Like the President of the United States he has the right of veto, and a bill may be passed over his veto by a $\frac{2}{3}$ majority of the Congress. He is aided in his executive functions by a Council of State consisting of five members nominated by himself and six members chosen by the Congress. There is also a Ministerial Council or Cabinet which is divided into seven departments under six ministers:—Of the interior; of foreign affairs; of worship and colonization; of justice and public instruction; of finance; of war and marine; of industry and public works. The legislative power is in the hands of a Congress consisting of two chambers called respectively the Senate and the Chamber of Deputies. The Senate consists of members elected for six years by the provinces. The number of senators bears the ratio of one for every three deputies. The deputies are chosen for a period of three years by the departments. The ratio of representatives to the population is one deputy to every 30,000 inhabitants. The deputies and senators are required to have a certain income, and do not receive salaries. The provinces are governed by intendentes, and are divided into departments which are under the administration of a governor. Both the provincial and department chiefs are nominated by the president. The departments, again, are divided into sub-delegations or cantons, under sub-delegates appointed by the governors, and into town-districts under inspectors appointed by the sub-delegates. The town-districts elect, every three years, their own municipal government. The judicial system is presided over by the Supreme Court, resident at Santiago, consisting of six members. It takes cognizance chiefly of cases of real estate, criminal cases, and war claims. Each department has one or more justices of the peace for ordinary cases. There are courts of appeal at Santiago, Serena, and Concepcion. The civil code, promulgated in 1858, is largely a copy of the Code Napoléon, and the military code is largely taken from the ordinances of Spain.

Finance.—Chile ranks very high among the South American states in the matter of financial credit. In 1894, its revenue amounted to 83,436,000 pesos, and its expenditures to 78,482,000 pesos. The estimated revenue for 1897 was 79,200,000 pesos and expenditures 79,155,971 pesos. The public debt of Chile on Dec. 31, 1895, was: external, £13,539,760; internal, 36,624,581 pesos. In 1896 there was a 5 % loan negotiated in London for the purpose of defraying the expenditures of railway construction and other public works. There is no state bank in Chile, but there is a national banking system in accordance with which the banks are required to guarantee their note issue by depositing government notes or securities in the Treasury. The number of joint stock banks of issue in 1895 was 23 with a capital of 50,818,829 pesos. Their registered issue was about 19,500,000 pesos, which is within the authorized limit of 24,000,000 pesos. There are also land banks which issue interest bearing scrip, payable to bearer, and loan money on the security of landed property. By the conversion law of Feb. 11, 1895, it was required that the redemption of paper currency should be carried out from June 1st of that year, at the rate of 18d. to a peso. In 1896, the value of a peso in United States money was 36½ cents.

Defence.—According to the law of Nov. 22, 1895, the regular army must not exceed 9,000 men. It consists of 5 regiments of artillery; 9 of infantry; 8 of cavalry; and 4 of engineers. Besides the regular army there is a National Guard which is subject to mobilization whenever required. Every Chilean between the ages of 20 and 40 is obliged to serve. It is estimated that under this system some 25,000 will annually receive military instruction. In 1896 the Chilean fleet, including ships in process of construction, consisted of 4 armorclads, 5 large cruisers, several small cruisers, and a torpedo flotilla. The small battleship *Capitan Prat* is a remarkable vessel. Her guns are worked either by electricity or by hand, and she possesses a powerful armament, and at the same time is capable of a high rate of speed. Another powerful vessel of the Chilean navy is the *Esmeralda*.

Population, etc. The aboriginal races comprise the Araucanians (see ARAUCANIA), polytheists in religion, divided into tribes under a cacique, the industrious agriculturists and rearers of herds, and the Patagonians, monotheists (see PATAGONIA). The other inhabitants, or Chileans proper, are of Spanish descent but mostly of mixed

blood. Their language is Spanish with some admixture of Indian words, and their customs and characteristics are European. The country is divided into 22 provinces. According to the official census of 1885, the population was 2,527,320. In 1894, according to the official estimate of December of that year, it had increased to 2,963,687. The following table, taken from the *Statesman's Year Book* for 1897, gives the area and population according to the census of November 26, 1885, together with the estimated population, etc., for 1894.

PROVINCES AND TERRITORIES.	Capitals.	Area; Sq. m.	Population 1885 Census.	Pop. estimated Dec. 1894	Pop. per Sq. m. 1894.
Magallanes, territory.....	Punta Arenas.....	75,292	2,085	3,624

Grand Total.....	293,970	2,527,320	2,963,687	10.8

In 1885 there were: 1,263,645 males and 1,263,675 females, and the foreign population numbered 87,077, including 34,901 Peruvians, 13,146 Bolivians, 9835 Argentines, 6808 Germans, 5303 English, 4198 French, 4114 Italians, and 2508 Spanish, etc. The Anglo-Americans numbered only 924. The cities having a population exceeding 20,000 in 1890 were: Santiago, 250,000; Valparaíso, 150,000; Talca and Concepcion, each 24,000, and Chillán, 21,000. The births, in 1895, were 110,154, and the deaths 92,197. In 1895 a new census was taken and the preliminary report of it was issued in 1897. According to this, the total population of the Republic was 2,712,145, an increase of 184,824 over the census of 1885. The following provinces showed the largest increase, Cautín, Malaco, Santiago, Antofagasta and Tarapacá. The following provinces showed a decrease, Bio-Bio, Arauco, Linares, Aconcagua and Coquimbo. The chief statistician said in his report that the figures might be far from giving a correct census of the population, for he had been informed that in some rural districts $\frac{2}{3}$ of the inhabitants did not figure in the census reports. See the monthly bulletin of the Bureau of American Republics, April 1897. See also Sir Horace Rumbold, *Le Chili* (Paris, 1877); Robiano, *Chili* (Paris, 1882); Markham, *The War between Chili and Peru* (1883); the United States navy report, *The War on the Pacific Coast of South America* (Wash., 1885); the *Historia General*, by Arana (Val., 1863), and that by Rosales (1878), and Briseño, *Catálogo de su Biblioteca Chileno-Americana* (Santiago, 1887).

CHILLÁN, a town in the province of Ñuble, Chile; 120 miles northeast of Concepcion, 35° 56' south, and 71° 37' west. The houses have only a ground floor and are built around rectangular courts; the streets are sixty to seventy feet wide, having open drains in the centre. C. is in the centre of a large agricultural district of great productiveness, and is an important outlet for grain and cattle by railroad to Tome. The place is also celebrated for mineral baths. The town was founded by Ruiz de Gamboa in 1594, but has since been several times destroyed and reconstructed. Its present population is about 21,000.

CHILLED STEEL. See **ANNEALING**; **IRON**.

CHILlicoTHE, a city, and co. seat of Livingston co., Mo., on the Wabash, the Burlington Route, and the Chicago, Milwaukee, and St. Paul railroads; 74 miles n.e. of Kansas City. It is the largest city in the Grand River valley; has large agricultural, lumbering, coal mining, and stock raising interests, electric lights and street railroads, and waterworks; and contains a normal school and business college, Hazleton public school, St. Joseph's Academy, high school, national banks, and daily and weekly newspapers. Pop. '90, 5717.

CHILlicoTHE, a city and co. seat of Ross co., Ohio, on the Scioto river, the Ohio and Erie canal and the Baltimore and Ohio Southwestern, the Cincinnati, Hamilton, and Dayton, and the Norfolk and Western railroads; 50 miles s. of Columbus. It is in an agricultural and iron and coal mining region, and has churches, banks, court-house, railway shops, and manufactures of wagons, furniture, paper, etc. Founded in 1796, and former capital of the state. Pop. '90, 11,288.

CHILLINGHAM CATTLE, a breed of the so-called wild cattle of Britain (*Bos taurus* var, *Scoticus*), preserved in Chillingham Park, Northumberland, England. This park, the property of the Earl of Tookerville, is a remnant of one of the great forests of Britain. It was formerly believed these cattle, other herds of which are found at Cadzow, near Chillingham, at Chartley, Staffordshire, Somerford and Lyme, Cheshire, and Kilmory, Argyllshire, had descended from the Urus (q.v.) without contact with any domesticated breed, but it is now held that the remote ancestors of the existing animals must have been partially domesticated. The Chillingham cattle, which approach most nearly to the true *primigenius* type, number about sixty, and are described as of medium size, compact in body, and dingy-white in color, with black-tipped horns, brownish muzzle, and red ears. They are timorous, unless hard-pressed, and feed by night. The cows conceal the calves under tall ferns and undergrowth, and resist all approach to them. It is said that these cattle refuse to mingle with any other. This prevents degeneracy of breed, and the accepted characteristics are also maintained by destroying any calf that shows deviations of color.

CHILLINGWORTH, WILLIAM, a famous theologian of the church of England, was b. at Oxford in 1602, and educated at Trinity college in that university, where the arguments of a Jesuit named Fisher induced him to become a Roman Catholic. He withdrew to Douay; but was induced by his godfather, Dr. Laud, then bishop of London, to re-examine the whole controversy between Catholics and Protestants, and, in 1631, he returned to the bosom of the Anglican church. Four years later, he published a work, entitled *The Religion of Protestants a Safe Way to Salvation*. It was exceedingly keen, ingenious, and conclusive in point of argument. C. was perhaps the ablest disputant of his age; and had there not been a certain fickleness and want of solidity about his intellect, and a nervous suspicion that all human reasoning might be vitiated by undiscovered fallacies, he might have produced a really great work. *The Religion of Protestants* acquired a wide popularity. C. was offered church preferment, which he at first refused—having certain scruples in regard to the subscription of the 39 articles—but afterwards accepted. He became chancellor of the church of Sarum, and prebendary of Brixworth, in Northamptonshire. He was a strong royalist, and, on the breaking out of the civil war, accompanied the king's forces. He died Jan., 1644. The best edition of *The Religion of Protestants* appeared in 1742, with sermons, etc.

CHILLON, a celebrated castle and fortress of Switzerland, in the canton of Vaud, 6 m. s.e. of Vevey. It is situated at the e. end of the lake of Geneva, on an isolated rock, almost entirely surrounded by deep water, and is connected with the shore by a wooden bridge. The castle is said to have been built in 1238, by Amadeus IV. of Savoy, and it long served as a state prison. It is famous as the prison of Bonnivard, the prior of St. Victor, who having, by his efforts to free the Genevese, rendered himself obnoxious to the duke of Savoy, was carried off by emissaries of that potentate, and confined here for six years, at the end of which time the castle had to surrender to the Bernese and Genevese, when Bonnivard was liberated. C. has been immortalized by Byron's *Prisoner of Chillon*. The castle is now used as a magazine for military stores.

CHILMA'REE, or **CHALAMARI**, a t. in British India, in the presidency of Bengal, 35 m. s.e. of Rangpur, on the Brahmaputra. It is remarkable chiefly as the seat of a great religious and commercial festival.

CHILOÉ', the insular province of Chili (q. v.), is an archipelago on the w. side of South America, which takes its name from its principal island. It is separated from the rest of the republic, or rather from Patagonia, by the gulf of Ancud, extending in s. lat. from 41° 40' to 43° 20', and in w. long. from 73° to 74°. The province—which, in 1894, numbered 82,262 inhabitants—contains, in addition to C. proper, about 60 islets, of which about 30 are uninhabited. In the archipelago are two towns, both of them seaports of C. proper—Castro, the ancient capital; and Ancud, or San Carlos de Ancud, the modern seat of government, towards the n.w. extremity. The atmosphere, like that of the mainland opposite, is excessively moist; the westerly winds, more particularly in winter, bringing almost constant rains. The climate, however, is on the whole healthy. This fact is the more remarkable, inasmuch as C. proper (95 miles by 35) is one natural forest, with a partially cleared and cultivated margin on the sea. The chief products are wheat, barley, potatoes, apples, and strawberries; and cattle, sheep, and pigs are reared in considerable numbers. Agriculture, however, is in a very primitive state; and the staple food of many consists of mussels and oysters. The population, equally indolent and poor, has a great preponderance of aboriginal blood. Schools are numerous, but, from the ignorance of the teachers, education has not made satisfactory progress. The principal manufacture is a coarse woolen cloth dyed blue. This archipelago was discovered by the Spaniards as late as 1558; and as it was the last integral portion of Spanish America to be colonized, so also was it the last to throw off the mother-country's yoke.

CHILOGNA'THA and **CHILO'PODA**. See MYRIAPODA.

CHILON, or **CHILO**, one of the seven sages of Greece, by birth a Lacedæmonian. He appears to have lived about the 6th c. B.C. It is said that he died from joy, on learning that his son had gained a prize in the Olympian games. Many of his apophthegms have been handed down to us. According to Chilon, the greatest virtue of man was prudence, or well-grounded judgment as to future events.

CHILPERIC, the name of two kings of the Franks. Chilperic I. obtained the kingdom of Soissons on the death of his father, Clotaire I., in 561. He was assassinated in 584.

CHILTERN HILLS, the s. part of the low chalk range which runs n.e., about 70 m., from the n. bend of the Thames, in Oxfordshire, through Bucks and the borders of Herts and Beds, and ends in Norfolk and Suffolk.

CHILTERN HUNDREDS. In former times, the beech-forests which covered the Chiltern Hills, in Buckinghamshire, were infested with robbers, and in order to restrain them, and protect the peaceable inhabitants of the neighborhood from their inroads, it was usual for the crown to appoint an officer, who was called the steward of the Chiltern Hundreds. The office, which has long ceased to serve its primary, now serves a secondary purpose. A member of the house of commons cannot resign his seat unless disqualified either by the acceptance of a place of honor and profit under the crown, or by some other cause. Now, the stewardship of the C. H. is held to be such a place, and it is consequently applied for by, and granted, in the general case as a matter of course, to any member who wishes to resign. As soon as it is obtained, it is again resigned, and is thus generally vacant when required for the purpose in question. When the C. H. are not vacant, however, the same purpose is served by the stewardship of the manors of East Hendred, Northshead, and Hempholme. As to the offices which are held to vacate seats, see ELECTION. "The practice of granting the C. H. for the purpose above described began only about the year 1750, and its strict legality has been doubted, on the ground that the stewardship is not an office of the kind requisite to vacate a seat. The gift of the C. H. lies with the chancellor of the exchequer, and there is at least one instance of its being refused. This was in 1842, and the circumstances will be found in the *Standard Library of Political Knowledge*, p. 500.

CHILTON, originally **BOKER**; a co. in central Alabama, having Coosa river on the e.; intersected by Louisville and Nashville railroad. Pop. '90, 14,549, incl. colored. Productions, corn, wheat, oats, cotton, and sweet potatoes. 710 sq.m. Co. seat, Clanton, formerly Grantville.

CHIMÆRA, a genus of cartilaginous fishes, and type of a distinct order, holocephali, which is often ranked with the sharks and rays, or elasmobranchs. The chief distinctions are the presence of a fold of skin covering the (4) gill-clefts, the nakedness of the skin, the fusion of the upper jaw to the skull, the separation of anal, urinary, and genital apertures. There are no spiracles nor "spiral-valve." There are two living genera—*C.* and *Callorhynchus*. The best-known species of *C.* (*C. monstrosa*), called in Gt. Britain *king of the herrings*, from its fondness for them, and in the U. S. *sea cat*, is found on the coasts of Europe and Japan, in the North Atlantic, and at the cape of Good Hope. It is seldom over 3 ft. in length, of a whitish color, spotted with brown above. The males have claspings organs; the large eggs are enclosed in a leathery case. See illustration, *FISHES*, vol. VI., figure 15. *C. Collettii* is found on the w. coast of North America; *C. Affinis* on the coast of Portugal. In *Callorhynchus*, a s. Pacific genus, the snout bears an appendage, and the tail is not symmetrical as in the above, but slightly shark-like.

CHIMÆRA, a mythical monster, described by Homer as having a lion's head, a goat's body, and the tail of a dragon. The rationalistic account of *C.* is, that it represented a mountain in Lycia whose top was the resort of lions, its middle of goats, and the marshy ground at the bottom of which abounded with serpents. In the same manner, Belerophon's (q.v.) victory over the *C.* is explained by saying, that he first made his residence on this mountain. The myth seems, at all events, to have belonged to Asia Minor, as gigantic carvings of the *C.* on rocks are there found. It is usually represented as a lion, out of the back of which grows the head and neck of a goat.—*C.* is used figuratively to denote any monstrous or impossible conception, the unnatural birth of the fancy. It is frequently depicted on shields, as a heraldic charge.

CHIMAPHILA. See WINTER-GREEN.

CHIMARRA, or **CHIMARI**. See CERAUNIAN MOUNTAINS.

CHIMAY, a town in the province of Hennegau (Hainaut), Belgium, an arrondissement of Thuise, on the river Blanche, and on the railroad from Marienbourg to Laon, 32 miles s.e. of Mons. It has a fine chateau situated in a park belonging to the Prince of Chimay, two churches, an atheneum, a bishop's seminary, iron works, breweries, and marble quarries. Pop. 1890, 3308.

CHIMAY, JEANNE MARIE IGNACE THÉRÈSE, Princess of; 1773–1835; daughter of count Cabarrus, minister of finance in Spain; early married to M. de Fontenay, soon divorced, and next married to Tallien, the French revolutionist, whom she induced to engage in a plot for the overthrow of Robespierre, and thus made herself the chief promoter of the revolution of July, 1794. Her beauty and her free manners with her consequent social triumphs gave her husband offense, and he left her, going with Napoleon to Egypt. A mutual divorce followed on his return, and Jeanne then married count Caraman, with whom she lived peaceably. While ranking first among the beauties of the time, she was never admitted to court circles.

CHIMBORA CO, a conical peak of the Andes, in Quito, 20,517 ft. above the sea, but only about 11,000 above the level of its own table-land. It is capped with perpetual snow, and was long regarded as the loftiest mountain in the world. Latterly, how-

ever, it has been ascertained to be overtopped by some peaks, not merely of the Himalayas, but even of the central division of its own chain. Its lat. and long. are $1^{\circ} 20'$ s., and 79° west. The summit was for the first time reached by Stübel in 1872. Humboldt ascended within 2,138 ft. of it, and Boussingault and Hall within 1729.

CHIME RE, "the upper robe worn by a bishop, to which the lawn-sleeves are now generally attached." Since the time of queen Elizabeth, it has been of black satin, but previously it was of a scarlet color, like that worn by the bishops when assembled in convocation, and when the sovereign attends parliament.

CHIMES, music performed on bells in a church tower, either by the hands of a performer or by mechanism. The most perfect C. are to be found in Holland and Belgium.

This ancient and interesting class of music is believed to have originated in some of the German monasteries, and the first instrument for the production of C. to have been made in 1487 at Alost, in the Netherlands. Among the celebrated chimes of Europe are those of Copenhagen, Ghent, and Amsterdam. A number of bells is required for a proper execution of this music. The *carillons à clavier* are played like a piano-forte; the keys are handles connected with the bells by rods or cords, and the *carillonneur* employs his hands and feet to play an air. The pedals communicate with the larger bells for the bass. The keys on which the treble notes depend are struck with the hand, which is protected by a leather covering. It is stated that Potthoff, a blind organist of Amsterdam, was able to perform fugues on this instrument. The invention of carillon machinery is of modern origin; one person now is able by simply turning a barrel similar to that of a music box to chime eight bells with little difficulty. C. have been largely introduced into our American churches. In New York there are four churches that have large chimes, St. Thomas, Grace, Trinity, and St. Ann's. The C. of Christ church in Philadelphia, Christ church in Boston, and Trinity church in New York, are probably the oldest in this country. Little is known of the Trinity church bells, except that five of them were cast in London before the year 1845. The ten bells have an aggregate weight of about 15,000 lbs.; the largest weighs 3,081 lbs., the smallest, 700 lbs.; they are hung in a frame-work of wood, and the machinery is somewhat primitive. St. Thomas church has ten bells which were cast at Meneely's in w. Troy, and put up in 1874; they are very fine in tone and tune. Grace church has ten bells with an aggregate weight of 10,300 lbs., the largest, called the Rector's bell, weighs 2,835 lbs.; they are played on by means of a *carillon à clavier*, like those in Holland. The C. of old Christ church in Philadelphia are of historic interest. These bells were sent from England as a present from Queen Anne; they were taken down during the revolution, and sunk in the Delaware river, as it was feared the British might capture them. At the close of the war they were hung in the old belfry; and may now be heard on every holiday through the year. Christ church in Boston also has an ancient and notable chime. Full and partial chimes, the latter called peals, can now be heard in all parts of the country. There are three sets of chimes in Troy, N. Y. The church of the Good Shepherd, in Hartford; St. James church in Birmingham, Conn.; old St. John's in Savannah, Ga.; churches of different denominations in Indianapolis, Petersburg, Va.; Cleveland, O.; Concord, N. H.; Rochester, N. Y.; and many others, produce chime music. Worth mentioning are those of St. Ann's, in Brooklyn; St. John's, in Newark; Grace church, and St. Patrick's, in Buffalo; the cathedral of the Immaculate Conception, in Albany; St. Paul's, in Reading, Pa.; Pilgrim church, in St. Louis; in the bell-tower of Cornell university, at Ithaca, N. Y.; and in the college chapel at Amherst, Mass. The half C. and peals in the United States are very numerous. See BELL; BELL RINGING.

CHIMNEY (Fr. *cheminée*, Lat. *caminus*). There seems reason to believe that the C., in its present sense of a funnel from the hearth or fire-place to the roof of the house, is a modern invention. In Greek houses it is supposed that there were no chimneys, and that the smoke escaped through a hole in the roof. What the arrangement was in houses in which there was an upper story, is not known; perhaps the smoke was conveyed by a short funnel through the side-wall of the house, which seems to have been the first form of C. invented in the middle ages. The Roman *caminus*, again, was not a C., but a sort of stove; and it has been a subject of much dispute, whether the Romans had any artificial mode of carrying off the smoke, or whether it was allowed to escape through the doors, windows, and openings in the roof. As the climate and the habits of the people both led to the houses of the ancients being very much more open than ours are, it is probable that the occasional fires which they had of wood or charcoal may have given them no great inconvenience. It is known, besides, that the rooms in Roman houses were frequently heated by means of hot air, which was brought in pipes from a furnace below. In England, there is no evidence of the use of chimney-shafts earlier than the 12th century. In Rochester castle (*circa* 1130), complete fire-places appear; but the flues go only a few feet up in the thickness of the wall, and are then turned out through the wall to the back of the fire-place, the openings being small oblong holes. The earliest chimney-shafts are circular, and of considerable height. Afterwards, chimneys are found in a great variety of forms. Previous to the 16th c., many of them are short, and terminated by a spire or pinnacle, having apertures of various shapes.

These apertures are sometimes in the pinnacle, sometimes under it, the smoke escaping as from some modern manufacturing chimney-stalks which are built in the form of an Egyptian obelisk. Clustered chimney-stalks do not appear until late in the 15th c., when they seem to have been introduced simultaneously with the use of brick for this purpose. Each of the earlier clustered chimneys consists of two flues which adhere to each other, and are not set separate, as afterwards was the practice. Long after they were invented, and in use for other rooms, our ancestors did not generally introduce them into their halls, which, till the end of the 15th, or beginning of the 16th c., continued as formerly to be heated by a fire on an open hearth in the center of the hall, the smoke escaping through an opening in the roof known by the name of *louvre*. In many of the older halls in which chimneys exist, they have evidently been inserted about this period.

The action of a C. depends upon the simple principle, that a column of heated air is lighter than a cooler column of equal height; when therefore a flue full of heated air communicates freely by the lower part with the cooler air around it, the greater weight of the latter pushes the warm air upwards, and thus an ascending current is produced. Other conditions being equal, the draught of a C. will thus be proportional to its perpendicular height, and the difference between the temperature within and without it. The straighter and more perpendicular the C., the stronger will be the draught, because the friction of the ascending current will be less, and the cooling effect of a long or tortuous course will be saved. The maximum efficiency of a given C. is attained when all the air that passes up it enters by the bottom of the fire. In this case, its temperature is raised to the uttermost by passing through the whole of the fire, and the fire is at the same time urged to vivid combustion by the blast thus obtained. A powerful furnace may be constructed by connecting a suitable fire-place, capable of being closed all round excepting at the bottom, with a tall C.; and the amount of draught may be regulated by increasing or diminishing the aperture through which the air is admitted to the bottom of the fire-place, or by an adjustable opening above the fire-place, which will diminish the effective draught as its size is increased, or by a combination of both of these contrivances.

When the fireplace can be inclosed thus, there is little liability to descending currents or "smoky chimneys," as they are called, even when the C. is very short, or has a tortuous course. It is chiefly with open fireplaces that this defect occurs, and the means of prevention and cure is a subject of some interest and importance. As with most other evils, the prevention is far easier than the cure; for by properly constructing the C. in accordance with the principles above stated—by placing the opening of the C. as nearly over the fire, and contracting the open space above the fire, as much as possible—downward smoking may in most cases be easily prevented. When a C. is in the neighborhood of a wall or building nearly as high as itself, or—what is still worse—higher, it is apt to smoke on account of the eddies and other complex currents in the air, caused by the interference which such an obstacle presents to the regular movement of the wind. In towns, such tortuous movements of the atmosphere are very common, and the contrivance for preventing the wind from blowing down the chimneys are very numerous, and often grotesque. Revolving cowls of various forms, but alike in having a nearly horizontal outlet, which is so turned by the wind that the mouth shall always point in the direction opposite to that whence the wind is blowing, are the most common, and usually the most effectual. They are generally constructed of sheet-zinc, with an arrow, a flattened pigeon, or other device, as a vane, to determine the rotation of the cowl. The curing of smoky chimneys, in conjunction with the economizing of fuel, was one of the favorite subjects of investigation of that very practical philosopher, count Rumford. He says: "Those who will take the trouble to consider the nature and properties of elastic fluids—of air, smoke, and vapor—and to examine the laws of their motions, and the necessary consequences of their being rarefied by heat, will perceive that it would be as much a miracle if smoke should not rise in a chimney—all hindrances to its ascent being removed—as that water should refuse to run in a siphon, or to descend a river. The whole mystery, therefore, of curing smoky chimneys is comprised in this simple direction: find out and remove those local hindrances which forcibly prevent the smoke from following its natural tendency to go up the chimney; or rather, to speak more accurately, which prevent its being forced up by the pressure of the heavier air of the room."* He then goes on to speak of above 500 smoking chimneys that he has had under his hands, and which were supposed incurable, and states that he was never obliged, "except in one single instance, to have recourse to any other method of cure than merely reducing the fireplace and throat of the chimney, or that part of it which lies immediately above the fireplace, to a proper form and just dimensions."

By his method, the opening of the fireplace resembles the half of a hexagon, whence it is better adapted for radiation into the room than the former square opening; the fire being brought further forward, has also more heating effect; the space of the fireplace being smaller, the air within it will, with a given sized fire, become hotter, and therefore

* *Essays: Political, Economical, and Philosophical*, by Benjamin count Rumford, vol. i. p. 299.

have more ascending power; while in the contracted throat widening downwards, and having its sides strongly heated, there is a rapid rush of heated air, which carries the smoke upwards, and resists the passage of temporary down-draughts. Most modern chimneys and fireplaces are now constructed in accordance with count Rumford's suggestions. See GRATE.

One frequent cause of smoky chimneys is the want of sufficient inlet for air to the room. Sand-bags placed under doors, and other devices for preventing ventilation, may cause a well-constructed C. to smoke. Openings must exist somewhere, of sufficient capacity to supply the air which is to ascend the chimney. If the air enters the room on the same side as the fireplace, and sudden gusts of air pass across the front of the fireplace, a temporary descending current is likely to be produced. The openings are best opposite the fire. For the methods of arranging and regulating such openings for the admission of air, see WARMING AND VENTILATION.

Tall factory-chimneys, usually built of brick, are very costly structures, many of them rivaling in height our loftiest cathedral spires. Their construction has been considerably economized by building from the inside, and thus saving the expensive scaffolding. Their walls are built very thick at the base, and gradually thinner upwards; recesses are left at regular intervals in the inside, and stout wooden or iron bars rest upon these to form a sort of temporary ladder for the workmen to ascend; the materials are hoisted by ropes and pulleys. Among the highest existing chimneys are the Towns-end shaft, Port Dundas, Glasgow, 468 feet, with diameter at base of 32 feet; the St. Pollux shaft, Glasgow, 455 feet, 6 inches; the Fall River Manufacturing Company's shaft, Fall River, Mass., 341 feet; and the Clark Company's shaft, Newark, N. J., 320 feet.

CHIMPANZEE, *Troglodytes niger*, a species of ape; one of those which in form and structure exhibit the greatest resemblance to man. It is a native of the warmest parts of Africa; to which also the gorilla (q.v.), a larger species of the same genus, belongs. The C. is sometimes called the black orang; but differs from the orang (q.v.) (*pithecus*) of Asia in the proportionally shorter arms, which, however, are much longer than those of man; in the possession of an additional dorsal vertebra, and an additional or thirteenth pair of ribs; and in other particulars, in some of which it more nearly resembles, and in others more widely differs, from the human species. In both, the difference from man is very wide in the general adaptation of the structure for movement on all-fours and for climbing and moving about among branches, rather than for erect walking, although the C. is able to move in an erect posture more easily than any other ape, usually, however, when so doing, holding its thighs with its hands; and still more in the form of the skull, and consequent aspect of the countenance, the facial angle being as low as 35° in the C. when it is measured without regard to the high bony ridges which project above the eyes; the jaws excessively projecting, and the outline of the face rather concave. There is also an important difference from the human species in the dentition; although the number of teeth of each kind is the same, the canine teeth of the apes are elongated, so as to pass each other, and corresponding intervals are provided for them in the opposite jaw. An interesting point of difference of the anatomy of the C. and orang from that of man, is in the muscle which in man terminates in a single tendon, and concentrates its action on the great toe, terminating in the apes in three tendons, none of which is connected with the great toe or hinder thumb, but which flex the three middle toes; part of the adaptation of the foot for clasping as a hand. The great toe both of the C. and orang is shorter than the other toes, and opposed to them as a thumb.

The C. does not seem to attain a height of quite 4 ft. when in an erect posture. Its skin is thinly covered with long black hair in front; the hair is thicker on the head, back, and limbs. The ears are remarkably prominent, thin, and naked, not unlike human ears in shape. The nose appears as little more than a mere wrinkle of the skin. The thumb of the hand is small and weak, that of the foot comparatively large and powerful. In a wild state, the animal appears to be gregarious, but its habits are not well known. Truth and fable have been so mixed up in the accounts of it that new information must be obtained from reliable sources, before even things not in themselves very improbable can be believed. In a state of confinement, it exhibits, at least when young, considerable gentleness and docility, and readily learns to imitate human actions, in eating with a spoon, drinking out of a glass, and the like; but its intelligence does not appear to be superior to that of many other monkeys, or indeed of many kinds of brutes. Its natural food consists chiefly of fruit and other vegetable substances; in confinement, it exhibits a great fondness for sweetmeats and for wine. The C. is impatient of cold. See *illus.*, MONKEYS, ETC., vol. X.

CHIMSEYANS, Indians of the n.w. coast of North America, between 53° and 55° n., including several small tribes. They are noted, like the Indians of Alaska, for disfiguring themselves by inserting a large piece of wood or ivory in the under lip. Their language is said to be sonorous and comprehensive.

CHINA. See CHINESE EMPIRE.

CHINA, or CHINA-WARE. See POTTERY.

CHINA BARK, a name of cinchona (q.v.) bark, often to be met in books, and in common use on the continent. It is derived, not from the empire of China, but from *kina* or *quina*, the Peruvian name of cinchona.

CHINA CLAY, or KA'OLIN. See CLAY.

CHINA GRASS, or CHINESE GRASS, the popular name of a fiber used in China for the manufacture of a beautiful fabric known as *grass-cloth*. The name appears to have originated in the belief that the fiber was that of a grass; but this is not the case, it being chiefly obtained from *bahmeria* (q.v.) *nivea*, a plant allied to the nettle. Besides this and other species of the natural order *urticaceæ*, other plants, as species of *corchorus* (q.v.) and *sida* (q.v.) are believed to yield fibers employed in the same manufacture. The fibers are said not to be spun after the European manner, but joined into long threads by twisting their ends together. Grass-cloth is now brought in considerable quantity to Europe, especially in the form of pocket-handkerchiefs. It has a fine glossy appearance and a peculiar transparency.

CHINANDE'GA, a t. of Central America, Nicaragua, stands in a fertile plain at the foot of some mountains, about 18 m. n.w. of Leon, and about 10 m. from the Pacific coast. The houses are straggling, of one story, built of adobes, and many of them are inclosed by gardens and plantations. Maize, sugar, cotton, hides, and poultry are produced in the vicinity. It is the capital of a department of the same name. Population variously estimated at from 7000 to 12,500.

CHINA INK, another name for Indian ink (q.v.).

CHINA ROOT, the root, or rather the *rhizome* (root-stock) of *smilax China*, a climbing shrubby plant, closely allied to sarsaparilla, and belonging to the same genus; a native of China, Cochín-China, and Japan. See SARSAPARILLA and SMILACEÆ. The stem is round and prickly, the leaves thin and roundish oblong; the rhizome tuberous and large; sub-astringent and diaphoretic. It is occasionally used in medicine, and is imported in a dry state into Europe; but it is also employed in the e. as an article of food. It abounds in starch.

CHINA TREE. See PRIDE OF INDIA.

CHINA WAX, produced by an insect which lives on the ash trees of China. It is scraped from the limbs, melted and strained, when it resembles bees-wax.

CHINA WEDDING. See WEDDING ANNIVERSARIES.

CHINCHA ISLANDS, three small islands in the Pacific, 13° 38' s. and 76° 28' w., 12 m. from the coast of Peru, and 106 m. from Callao. The largest, known as north island, is only about 170 acres in surface. The importance of the islands is owing to their immense deposits of guano. They are of granitic formation, rising from the sea in precipitous cliffs, worn into countless caves and hollows, which furnish convenient resting places for sea-fowl. Their highest point, now 113 ft., was once nearly 90 ft. higher, the whole deposit being of guano. The name of the islands and of the town and valley of Chinchá in the mainland is derived from an ancient Indian race, which has left some interesting relics of its sojourn. A stone idol and two water-pots of grotesque form were discovered under 62 ft. of guano; and a number of wooden idols, two regal emblems, and a curious stone slab have been found. In 1846, the amount of guano in these islands was estimated to be 18,250,000 tons, and in 1852 there still remained 12,360,000 tons. The supply is now quite exhausted.

CHINCH BUG, *Blissus leucopterus*, an insect which has sometimes done immense damage to wheat and other crops in the western United States. The female lays her eggs on the ground, and there are often two swarms of bugs in a single year, one in June and one in the autumn. The chinch bug is from a seventh to a fifth of an inch in length; the wing-covers are black, with three or four white dashes, sometimes wanting; the body is usually black, though the unwinged young are at first red, with a white band on the back.

CHINCHEW, or CHINCHU, the name of an ancient and famous port of China, in the province of Fuh-keen, 27° 57' n. and 118° 35' east; now termed Changchow. Though occasionally visited by missionaries and others, Chinchu is not one of the treaty ports. CHINCHU, or TSINENCHOU, is also the name of a district on southeastern coast of China, comprising parts of the provinces of Fuh-keen and Kwang-tung. Its inhabitants are a hardy seafaring people, many of whom enter the imperial navy or man the merchant marine.

CHINCHILLA, *Chinchilla*, *Eriomys*, or *Callomys*, a genus of South American quadrupeds, of the order *rodentia*; the type of a family, *chinchillidæ*, allied to *caviæ* (*caviæ*), but differing from them in possessing clavicles. The general aspect is somewhat rabbit-like. There are several genera of *chinchillidæ*, distinguished in part by the number of toes, the true chinchillas having four, with the rudiment of a fifth on the fore-feet, and four on the hind-feet; whilst in the genus *lagidium*, or *lagotis*, there are four on each foot;

and in *lagostomus*, four on the fore-feet and three on the hind-feet. All the species of this family are gregarious; feed much on roots, for which their strong and sharp incisors are particularly adapted; and live either in holes, which they select for themselves in rocky districts, or in burrows, which they excavate. They are valued for their fur, particularly the CHINCHILLA of the Andes (*C. lunigera*), of which the fur constitutes an important article of commerce. Their numbers are said to be sensibly decreasing in consequence of the demand for the fur. The ancient Peruvians were accustomed to employ the wool of the C. for the manufacture of fine fabrics. See *illus.*, DEER, ETC., vol. IV.

CHINCHILLA, a t. of Spain, in the province of Albacete, 10 m. s.e. of the city of that name. It is situated on an abrupt rocky hill, crowned by a castle, and is surrounded by walls. The town is in general well built, with good streets, and a fine parish church, containing some excellent works of art. It has manufactures of cloth, linen, leather, earthenware, and glass, and a trade in the agricultural produce of the district. Pop. '87, 6096.

CHINCHON', a t. of Spain, in the province of Madrid, 25 m. s.s.e. of the city of that name. It is pleasantly situated on a hill near the Tagus, and is well built, with wide, regular, and clean streets. Agriculture forms the chief occupation of the inhabitants, but leather, linen, and earthenware are manufactured to a small extent. Pop. 5000.

CHINDWA RA, a t. in the central provinces of India, lat. 22° 3' n., and long. 78° 58' east. It occupies a plateau amid the Deoghur mountains, standing 2,100 ft. above the level of the sea. Its climate is consequently one of the most agreeable and salubrious in India, attracting many visitors in search of health or recreation. Pop. 9000.

CHINE, LA, a town in Jacques Cartier co., Quebec, Canada, on Lake St. Louis and the Grand Trunk railroad; 8 miles w. of Montreal. It is a place of summer residence of many citizens of Montreal and a popular winter resort of pleasure parties. A canal, built to avoid the rapids on the St. Lawrence, connects the town with Montreal, and all the water commerce between that city and the west passes through this canal. The town is the starting and landing-place for the Ottawa line of steamers and the Royal Mail line of steamers for Kingston, etc. There are churches, schools, and numerous hotels. The name is now written "Lachine," and was given to the site, it is said, by Cartier, who supposed that at this point in his explorations he must be within easy access of China. Pop. '91, 3761.

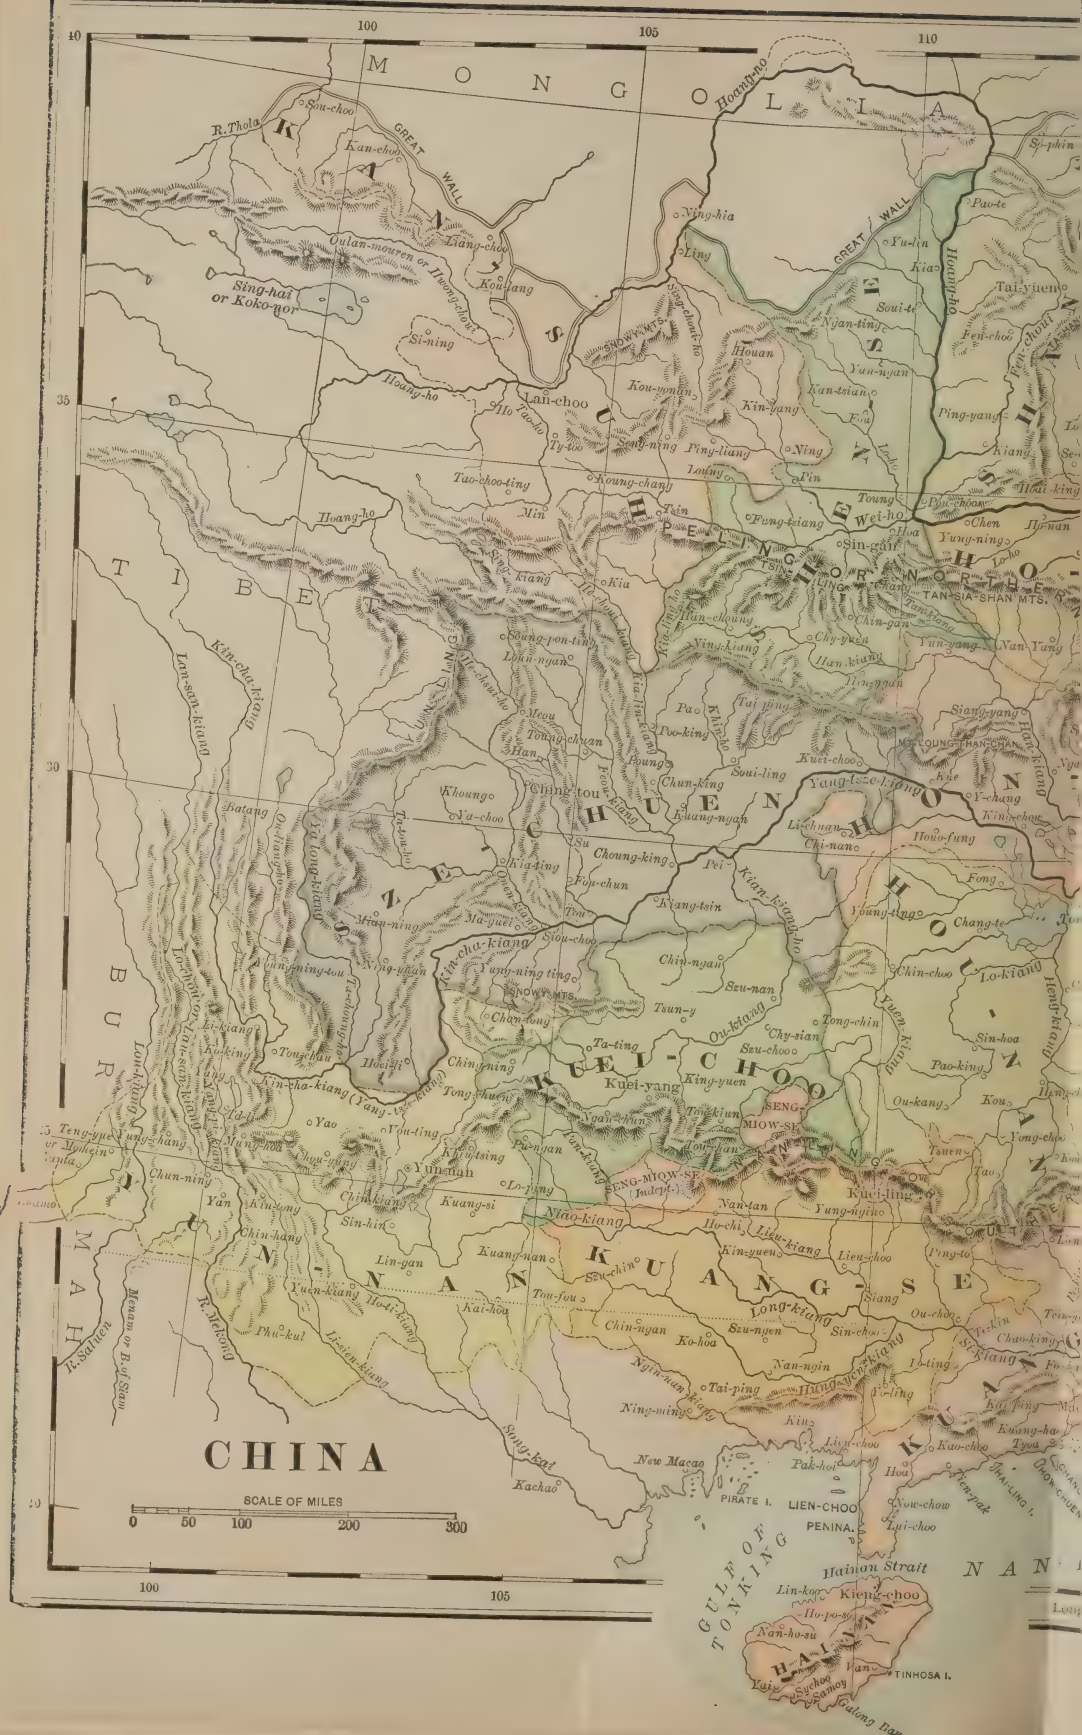

CHINESE EMPIRE, a vast territory in eastern Asia, comprehending besides China proper, with its eighteen provinces, the five dependencies of Manchuria (q.v.), Mongolia (q.v.), Thibet (q.v.), Jungaria and East Turkistan. The island of Formosa formerly reckoned as a separate province, but was acquired by Japan in 1895.

China Proper occupies the eastern slope of the table-lands of central Asia. In form it approaches to a square, and covers a surface eighteen times as large as Great Britain. It is inhabited by more than 380 millions of the human race, living under the same government, ruled by the same laws, speaking the same language, studying the same literature, possessing a greater homogeneity, a history extending over a longer period, and a more enduring national existence than any other people, whether of ancient or modern times; indeed, when we consider its high antiquity, its peculiar civilization, its elaborate administrative machinery, its wondrous language, its philosophy and classic literature, its manufacturing industry and natural productions, giving rise to such a gigantic commerce with our own land, China is perhaps the most remarkable country in the world, and is worth a closer and more serious study than has yet been generally accorded to it. China proper is included between 18° and 40° n. lat. (which takes in the island of Hainan), and 98° to 124° e. longitude. Its coast-line exceeds 2,500 m. and the land-frontier 4,400 miles. A line running direct n. and s. would give a length of 1474 m.; and another at right angles to this, 1355 m.; but one drawn diagonally from its north-eastern extremity through Yun-nan would measure 1669 miles. The area of China proper is given as 1,336,841 sq. m.; but this measurement, though based on official estimates, must be taken as a mere approximation, and some accounts give it an area of more than a million and a half square miles.

Physical Features.—China has a general slope from the mountains of Thibet to the shores of the Pacific. The two principal mountain-chains divide it into three longitudinal basins, drained by those great rivers for which China is famous. Within its provinces are found alluvial plains, fertile river-valleys, large populous towns, as well as thinly inhabited, hilly, and mountainous regions. To describe its surface more particularly, it may be viewed under its natural divisions of mountainous country, hilly country, and the great plain. The first comprehends more than half the region between the meridian 113° and Thibet. East of this meridian, and to the s. of the Yang-tse-kiang river, is the hilly country, which includes the provinces of Fuh-keen, Keang-se, Kwang-tung, and a portion of Hu-nan and Hu-pih; while to the n.e. stretches the great plain. This latter extends from the great wall to 30° n. lat.; a line drawn from King-chow in Hu-pih to Hwae-king on the Yellow River, may be considered its western limit; and the sea forms its boundary on the east. This vast and generally fertile tract has an area of 210,000 sq. miles, and supports a population of 177 millions.

From the mountains of Thibet two grand ranges stretch across China, having a general direction from s.w. to n.e. The more northerly of these—the Thsin-ling or Blue moun-

tains—are included between the parallels of 31° and 34° . The southern or Nan-ling chain is a spur of the Himalayas. Commencing in Yun-nan, it bounds Kwang-se, Kwang-tung, and Fuh-keen on the n., and passing through the province of Che-keang—where some of its peaks reach the height of 12,000 ft.—enters the sea at Ning-po; thus forming a continuous barrier—penetrated only by a few steep passes, of which the Mei-kwan, or Mei Pass, is the best known—that separates the coast-land of south-eastern China from the rest of the country. This great chain throws off numerous spurs to the s. and e., which, dipping into the sea, rise above it as a belt of rugged islands along the southern half of the Chinese sea-board. Of this belt, the Chusan archipelago is the most northerly portion.

The magnificent *river-system* of China is represented by those noble twin streams, the Hoang-ho or Yellow river, and the Yang-tse-kiang, which, springing from the same water-shed, the eastern mountains of Thibet, are widely separated in their mid course, but enter the sea within 2° of each other. The former has its source in $35\frac{1}{2}^{\circ}$ n. lat. and about 96° e. long.; and after a very tortuous course, empties itself into the ocean in lat. 34° .* It is a “mighty, impracticable, turbid, furious stream” for the most part, and little adapted for Chinese navigation. But the river most beloved by the Chinese is the Yang-tse-kiang, or “son of the ocean”—more correctly translated, “the son that spreads”—which name is only applied to it by the natives below the commencement of the delta; for above that it is called simply Ta-kiang or Great river. The basin drained by it is estimated at 548,000 sq. miles. Of the other rivers that water the country, the Peiho in the n., and the Choo-keang in the s., are the most noteworthy.

The principal *lakes* of China are five in number—viz., the Tung-ting-hu, in 113° e. long., with a circumference of about 220 m.; the Poyang-hu, in 116° e. long., 90 m. in length by 20 in breadth; the Hung-tsin-hu, in Keang-su; the Tsau-hu, between Ngan-kin-fu and Nankin; and the Tai-hu, in 120° e. long. On these lakes, artificially constructed floating islands, with houses, fields, and inhabitants, animals, and birds, are sometimes seen.

The *Grand Canal* has very greatly facilitated the internal navigation of the country. In the past the great annual grain-fleet, with its 430,000 tons of rice for the use of the capital, passed from the s. to the neighborhood of Peking by this great water-way; thus avoiding the storms and pirates of the coast, but the alteration already mentioned in the course of the Hoang-ho, has rendered it comparatively useless. It connects Tientsin in Chih-le with Hang-chow in Che-keang; though the canal proper commences in Shan-tung, and its total length is about 650 miles.

Another world-famous structure is the *Great Wall*—called Wan-li-chang (myriad-mile-wall) by the Chinese—which was built by the first emperor of the Tsin dynasty about 220 B.C., as a protection against the Tartar tribes. It traverses the northern boundary of China, extending from $3\frac{1}{2}^{\circ}$ e. to 15° w. of Peking, and is carried over the highest hills, through the deepest valleys, across rivers and every other natural obstacle. The length of this great barrier is, according to McCulloch, 1250 m. Including a parapet of 5 ft., the total height of the wall is 20 ft.; thickness at the base, 25 ft.; and at the top, 15 ft. Towers or bastions occur at intervals of about 100 yds. These are 40 ft. square at the base, and 30 ft. at the summit, which is 37 ft., and in some instances 48 or 50 ft., from the ground. Earth inclosed in brickwork forms the mass of the wall; but for more than half its length it is little else than a heap of gravel and rubbish.

Geology.—The high lands, where are the sources of the great rivers of China, consist of granitic and metamorphic rocks. These are continued round the s. and s.e. of the country, until they leave a huge basin, through which flow the Yang-tse-kiang and Hoang-ho, occupied by fossiliferous strata. The wild and rugged scenery of the larger portion of China is owing to the predominance of those crystalline and sub-crystalline rocks. The fossiliferous strata exhibit representatives of the various formations. The paleozoic rocks are but sparingly developed in a narrow stripe which runs from near Peking in a south-westerly curve, to nearly the center of the empire. Cretaceous rocks occur in the valley of the Yang-tse-kiang. Tertiary beds fill up the eastern portion of the immense basin; while extensive districts to the w. of this region, extending to the crystalline rocks in the extreme w., are covered with modern detritus.

In the northern part of China a peculiar feature of the soil is a formation termed *loess* or land-loam, which is found especially in the provinces of Chih-le, Shan-se, Shen-se, Kan-su, and Ho-nan. It is also found in the peninsula of Leao-tung, in parts of Shan-tung, southern Ho-nan and the vicinity of Tung-ting and Po-Yang lakes. It is a brownish earthy deposit, having considerable fertility, and its depth varies from a few inches to thousands of feet. The action of the weather is apt to wear it away in such a manner as to form terraces and precipices. It is soft and easily washed away from the banks of streams, a fact which accounts for the spreading of the river bed, frequent in the inland waters of China. See the article **LOESS**.

Though no active volcanoes are known to exist, except one in Formosa, yet indications of volcanic action are not wanting. Salt and hot-water springs are found in Yun-

* The Hoang-ho has recently altered its course, and now enters the sea in a somewhat higher latitude. Such changes, causing losses, and entailing expense, are not unusual; and hence this river has been called “China’s sorrow.”

nan; sulphur springs near Foochow; and wells of petroleum in Shen-se and Formosa. The most famous amongst the *minerals* of China is jade or the yu-stone, obtained chiefly in Yun-nan.

Coal is found in all the eighteen provinces, and in its coal resources China may be regarded as one of the first countries in the world. The coal mines of northern Chih-le, worked under foreign direction, have been very productive, and mines have also been opened at Hankow. All the commoner metals are likewise found in China, especially iron and copper. Japanese engineers have been employed in Yun-nan to teach the natives modern methods in copper mining. Near the city of Ning-po are extensive stone-quarries.

Vegetable Productions.—The tea-plant (*thea viridis* and *thea bohea*) is the most important vegetable production of China. See TEA. The tallow-tree (*stillingia sebifera*), the *dryandra cordata* or varnish-tree, the camphor-tree (*laurus camphora*) the Chinese pine (*pinus sinensis*), the Chinese banyan (*ficus nitida*), the funeral cypress and the mulberry, are amongst the most important trees of China. The cocoanut and other palms flourish on the southern coast. Of the bamboo, which grows as far n. as lat. 38°, there are 63 principal varieties; and it is said that the bamboos of China are more valuable than her mines, and, next to rice and silk, yield the greatest revenue. The various uses to which they are applied is truly astonishing; and, amongst others, the bamboo is famous as an instrument of punishment. The fruits of both the tropical and temperate zones—apples, grapes, pomegranates, mangoes, pine-apples, three species of orange, the lichi, etc.—are found in the country; and camellias, azaleas, and gardenias are natives of the “flowery land.” The *nymphaea*, or water-lily, is greatly prized by the Chinese, both for ornament and in an economical point of view. *Agriculture* is held in higher estimation in China than, perhaps, any other country in the world. The agricultural system of the Chinese is rude, but effective; and every inch of arable land is carefully cultivated. Spade husbandry and irrigation are carried on to a great extent. The Chinese have an appreciation of the value of night-soil as a manure; for, while in other countries thousands of dollars’ worth are annually discharged into the sewers, in China it is everywhere saved, bears a high price, and is collected in a manner exceedingly offensive to American notions. In the northern provinces, the cereals are principally maize, barley, and wheat; but in the south, rice is raised in vast quantities, and forms the staple food of the people. Tobacco and the poppy are also raised in considerable quantities.

Animals.—Very little is really known of the zoology of China. Some of the more ferocious of the carnivorous animals still linger in the jungles of Yun-nan, and are occasionally found along the whole of the Nanling range of mountains as far as Ning-po, where there is a mart for their skins. Wild-cats are common in the forests of the south, and bears are still found in the hills of Shan-se. Of the ruminantia, there are the musk-deer (*moschus moschiferus*), the moose-deer, and a few other species. The gold and silver pheasant, the argus pheasant, and other gallinaceous birds, hold a prominent place in the ornithology of China. Fly-catchers, thrushes, grackles, and goat-suckers have their representatives in China, and there are several species of crows, jays, and magpies. Water-fowl inhabit the lakes, rivers, and marshes. The larger reptiles are unknown; but tortoises and turtles abound on the coast, and lizards are plentiful in the south. The ichthyology of China is considered to be one of the richest in the world. Sharks, rays, sturgeons, and other cartilaginous fishes, are common on the coast; and the carp formerly was very plentiful in the lakes and rivers. The goldfish has been introduced into Europe from China. Of insects, the arachnidæ are large and numerous; indeed, a tree-spider captures and kills small birds. Locusts often commit extensive ravages. Silk-worms are highly valued, and reared in large numbers.

In a country of such vast extent—extending from 18° to 40° n. lat.—the *climate* must vary greatly. Indeed, as regards both climate and productions, China may be divided into three zones—the northern, the central, and the southern. The northern zone extends to the 35th parallel, and includes the fine provinces of Shang-tung, Chih-le, Shan-se, Shen-se, and Kan-su. It produces the grains, fruits, and animals of northern Europe. Here the children are red-cheeked, and the extremes of heat and cold are great. In Chih-le, the winters are very severe; and at that season ice a foot thick renders the rivers unnavigable. The natural productions of this and the contiguous northern provinces are wheat, barley, oats, apples, the hazel-nut, and the potato; they are also rich in wood and minerals. The central zone, the richest portion of China, contains eight provinces—Sze-chuen, Kwei-chow, Hu-nan, Hu-pih, Keang-se, Gan-hwuy, Ho-nan, and Keang-su—and is bounded by the 27th or 28th parallel; tea and silk are its characteristic products; the middle portion is the granary of China, and the eastern part is celebrated for its manufactures of silk and cotton. The southern zone embraces five provinces—Yun-nan, Kwang-tung, Kwang-se, Fuh-keen, and Che-keang. The exchange of its tropical productions for those of the northern zone is an important branch of the internal commerce of the country. Kwang-tung lies partly within the tropics; and the whole province is tropical, both in climate and productions.

China has no regular census, and the estimates of its population are various. According to the figures of 1842, the population of the eighteen provinces of China proper and of Formosa was 415,000,000. Other estimates place it as low as 350,000,000. The

following table, taken from the *Statesman's Year Book* for 1897, is based on the official figures for 1882 and 1879, with the exception of Fuh-keen, which is estimated on the basis of the census of 1844.

PROVINCES.	Area : English Square Miles.	Population.	Population per Square Mile.

Total.....	1,312,328	383,253,029	292

At the end of the year 1895 the customs authorities returned the total number of foreigners living in the open ports of China at 10,091, of whom over 4,000 were British, 1,300 Americans, and the remainder Japanese, Frenchmen, Germans, Portuguese, Spaniards, Swedes, Norwegians, etc. After Peking the largest cities in China are, Canton, Tien-Tsin, Foochow, Hankow, Hangchow-Foo, Ning-po, Amoy, and Shanghai.

Inhabitants.—Ethnologically, the Chinese belong to that variety of the human species distinguished by a Mongolian conformation of the head and face, and a monosyllabic language. See CHINESE LANGUAGE, WRITING, AND LITERATURE. A tawny or parchment-colored skin, black hair, lank and coarse, a thin beard, oblique eyes, and high cheek-bones, are the principal characteristics of the race. The average height of the Chinaman is about equal to that of the European, though his muscular power is not so great; the women are disproportionately small, and have a broad upper face, low nose, and linear eyes. Of the general character of the Chinese, it is not easy to form a fair and impartial judgment; and those who have resided long in the country, and know them well, have arrived at very different conclusions. M. Huc asserts that they are "destitute of religious feelings and beliefs," "skeptical and indifferent to everything that concerns the moral side of man," "their whole lives but materialism put in action," but "all this," says Mr. Meadows, "is baseless calumny of the higher life of a great portion of the human race." He admits, indeed, that these charges are true of the mass of the Chinese, just as they are true of the English, French, and Americans; but as amongst these there is a large amount of generosity and right feeling, and also "a minority higher in nature, actuated by higher motives, aiming at higher aims," so also, he maintains, is there amongst the Chinese a similar right feeling, and a like minority who live a higher life than the people generally. See HIOUEN-THSANG. As regards valor, their annals record "deeds akin to the courage of antiquity;" they have no fear of death, commit suicide as the solution of a difficulty, and endure the most cruel tortures with a passive fortitude; but neither their arms nor discipline enable them to stand before European forces. The Chinese are, as a race, unwarlike, fond of peace and domestic order, capable of a high degree of organization and local self-government, sober, industrious, practical, unimaginative, literary, and deeply imbued with the mercantile spirit. It is to be observed that the inhabitants of China Proper are essentially one people; the differences, except in dialect, being hardly more marked than between the Northumbrian peasant and the Cornish miner. The south-eastern Chinese—the people of Kwang-tung, Fuh-keen, and the south of Che-keang—are the most restless and enterprising in all the eighteen provinces, and may be regarded as the Anglo-Saxons of Asia. In the mountainous districts of the four south-eastern provinces of China, but principally in Kwang-se, are certain tribes who maintain a rude independence, wear a peculiar dress, and are descended from the aboriginal inhabitants of China. Of these, the Meao-tze are the best known.

The manners and customs of the Chinese can only here be glanced at. The worship of ancestors is a remarkable and prominent feature in their social life, and is dictated by that principle of filial piety which forms the basis of Chinese society. The rich have in their houses a chamber—a kind of domestic sanctuary—dedicated to their forefathers. Tablets, representing the deceased persons, and inscribed with their names, are here carefully preserved; and at stated seasons, prostrations and ceremonies are performed

before them according to the book of rites. All Chinese worship from time to time at the tombs of their parents. In everything that relates to death and sepulture, the customs of the Chinese are no less singular. They meet their last enemy with apparent unconcern; but whilst their future state troubles them little, they regard the quality of their coffins as of vital importance, and frequently provide them during their lifetime; indeed, a coffin is reckoned a most acceptable present, and is frequently given by children to their parents. "To be happy on earth," say the Chinese, "one must be born in Su-chow, live in Canton, and die in Lianchau"—Su-chow being celebrated for the beauty of its women, Canton for its luxury, and Lianchau for furnishing the best wood for coffins. Yet death is never alluded to in direct terms, but indicated rather by periphrases, such as—the person "exists no more," "he has saluted the age," "ascended to the sky," etc. Banquets are offered to the dead, and pathetic speeches addressed to them. In China, *marriage* is universal, and within the reach of all; but there is a strict separation of the sexes, and betrothal is undertaken by the parents or by professional match-makers. Minute ceremonial observances regulate every step, and frequently the bride and bridegroom see each other on the wedding-day for the first time. Women hold a very inferior position, and are little better than slaves. Polygamy is not recognized by law, but secondary wives are common, especially when the first proves barren. Infanticide, though regarded as a crime, is undoubtedly practiced to some extent, as is proved by edicts issued against it; and parents possess almost unlimited authority over their children. The intercourse of the Chinese with each other, especially of the upper classes, is regulated by a tedious and elaborate etiquette; indeed, they are the slaves of custom, and everything is done by precedent. Many curious instances of Chinese politeness might be cited. The well-bred host presses many things on a visitor, which the latter must never dream of accepting. "A Chinaman," says Mr. Oliphant, "has wonderful command of feature; he generally looks most pleased when he has least reason to be so, and maintains an expression of imperturbable politeness and amiability, when he is secretly regretting devoutly that he cannot bastinate you to death." The *Le-king*, or book of rites, regulates Chinese manners, and is one cause of their unchangeableness; for here they are stereotyped, and handed down from age to age. The ceremonial usages of China have been estimated at 3,000; and one of the tribunals at Peking—the board of rites—is charged with their interpretation. Chinese cookery, in the use of made dishes, more nearly resembles the French than the English. Birds' nests soup, sharks' fins, deer-sinews, and ducks' tongues, are amongst its delicacies. The wine, or weak spirit (*tseu*), more correctly speaking, used by the Chinese is made from rice; and from this, again, they distill a stronger spirit, the "samshoo" of Canton. The former is drunk warm in minute cups at their meals; tea never appears during a repast, though it may be taken before or after. The Chinese have numerous *festivals*; and perhaps the most remarkable of these is that celebrated at the commencement of the new year, when unbounded festivity prevails. Preparatory to this, debts are settled, and the devout repair to the temples to gain the favor of the gods. The first day of the year may, in one sense, be reckoned the birthday of the whole people, for their ages are dated from it. Visiting is, at the same time, carried on to a great extent, whilst parents and teachers receive the prostrations and salutations of their children or pupils. The festival of the dragon-boats is held on the fifth day of the fifth month; and at the first full moon of the year, the feast of lanterns. In the manufacture of these the Chinese excel; and on the night of the festival, lanterns illuminate each door, wonderful in their variety of form and material.

In the matter of *dress*, the Chinaman exhibits his usual practical sense, and varies the material according to the season, from cotton-wadded or fur-lined coats to the lightest silk, gauze, or grass-cloth. On the approach of cold weather, he lights no fire in his dwelling, but puts on additional clothing until the desired temperature is attained. A tunic or kind of loose jacket fitting close round the neck, and a wide short trouser, are his principal garments. Shoes are made of silk or cotton, with thick felt soles. White is the color of mourning. The Tartar tonsure and braided queue became general with the Mantchu conquest of the country, since which 180,000,000 of men have the hair removed from their heads at short intervals; and as no Chinaman is his own barber, a great number of this calling find employment. The Chinaman is very sparing in his ablutions, and appears to be afflicted with a strange hydrophobia; for cold water, either as a beverage or for washing his person, he holds in abomination. Long nails are fashionable. The custom of the women differs but little from that of the men, and their shoes are the most remarkable part of their toilet. A lady's shoe measures about $3\frac{1}{2}$ in. from the heel to the toe. The feet of the Tartar women are left as nature made them; but amongst the Chinese, all young girls of the better classes are crippled by a tyrant custom. In early infancy the feet are tightly bound, the four small toes being tucked under the sole, of which, after a time, they become a part, and the heel is brought forward. The process is at length complete; stumps have been substituted for the ordinary pedal extremities, and the Chinese lady totters on her goat's feet.

The principal *manufactures* of the Chinese are silk, cotton, linen, and pottery, for which latter they are especially celebrated. The finest porcelain is made in the province of Keang-se. The Chinese invented printing in the beginning of the 10th c., and in 932 A.D. a printed imperial edition of the sacred books was published. The skill of the Chinese in handicraft is astonishing. Their rich silks and satins, light gauzes, beautiful embroidery, elaborate engraving on wood and stone, delicate filagree-work in gold and

silver, carvings on ivory, fine lacquered ware, antique vessels in bronze, and their brilliant coloring on the famous pith paper, command our admiration.

Education.—As the high road to official employment, to rank, wealth and influence, education is eagerly sought by all classes. Literary proficiency commands everywhere respect and consideration, and there are schools for primary instruction in the remotest villages. Self-supporting day-schools are universal throughout the country and the calling of teacher is followed by a great number of the *literati*, or educated classes. The Chinese have a remarkable reverence for the written character. Waste printed paper is collected from house to house and burned to preserve it from profanation. It is stated that in point of intellect, as well as in business ability and diplomatic skill, the Chinese are the equals of the most civilized races. Yet there are still a vast number of adult Chinamen who cannot read or write, and the study of nature until recent years has been greatly neglected. The native literature reveals very crude notions of animal physiology and medicine, as is shown by a scheme of anatomy which places the heart in the center with the other organs arranged around it. Translations of Western works of science, however, as well as of literature, have recently been introduced and are constantly on the increase. The chief educational institution for this purpose is *Tung wen Kwan*, or college of foreign knowledge, at Peking. This is a government institution which gives instruction in the English, French, German, and Russian languages, mathematics, astronomy, meteorology, chemistry, natural history, physiology, anatomy and Western literature, under the direction of European and American professors. The government provides state examinations which are held annually for literary honors and degrees, these latter being the necessary passports to the public service. In 1887 mathematics were for the first time admitted among the subjects in the examinations. Advanced knowledge is for the most part confined to the special literary class which ranks as the highest in the four social grades. At Shanghai there are a number of colleges under the control of Christian missionaries, and there, as at other ports, are elementary schools in which the English language and the elementary branches of science are taught. Besides these there are government naval and military colleges in connection with the arsenals at Tien-tsin, Nanking, Shanghai and Foochow. Foreign teachers are employed in these institutions for the purpose of inculcating to the young military and naval aspirants the Western science of warfare besides Western language and literature. In several of the treaty ports Chinese newspapers are published.

Government.—In the centralized autocratic government of China, the emperor is absolute in the empire, the governor in the province, the magistrate in the district. The emperor claims no *hereditary* divine right, and is not always the eldest son of the preceding monarch; the ablest son is nominated, but his right to the throne as the *Teen-tz*, or *Tien-tze*, "son of heaven," the *Fung-tien*, "divinely appointed," can only be established by good government, in accordance with the principles laid down in the national sacred books. If, on the contrary, he violates these principles, the people firmly believe that heaven signifies, by unmistakable signs, that their ruler is not its chosen representative. "The rivers rise from their beds, the ground sullenly refuses its fruits, the plains tremble, the hills reel, and the typhoon rages over seas and coasts, all alike uttering a 'Numbered, numbered, weighed and parted,' that requires no interpretation, but is read in anxiety by the people, in dismay and terror by the prince," who seeks by repentance and a return to the true principles of the government, to avert his doom. The emperor is absolute as legislator and administrator; but he must legislate in accordance with the general principles acknowledged in the country. He also constitutes, in his own person, the highest criminal court. The Chinese possess a carefully digested code of laws, which is added to and modified from time to time by imperial edicts. Their penal code commenced 2,000 years ago, and copies of it are sold at so cheap a rate as to be within reach of people of the humblest means. Death, which the Chinaman prefers to long confinement, is the penalty for a large number of offenses, and in ordinary years about 10,000 criminals are executed. Several modes of torture are legal. The emperor is assisted in governing by the privy council or grand council. The actual administration of affairs under the emperor is entrusted to the supreme direction of the *Nei-ko* or cabinet consisting of four members, of whom two are Chinese and two are of Manchu origin, besides two assistants from the Great College, who see that the administrative measures are not in conflict with the civil or religious laws of the Empire. Under the direction of these ministers of state are seven boards of government, or executive departments, each directed by two presidents, a Manchu and a Chinese. These boards are—1, the board of civil appointment, which looks after the appointment, salaries, and conduct of the civil officers; 2, the board of revenue, directing fiscal affairs; 3, the board of rites and ceremonies, regulating the customs and laws to be observed by the people; 4, the military board; 5, the admiralty board or naval department; 6, the board of public works; 7, the board of punishment, a high tribunal having criminal jurisdiction. Theoretically superior to all these departments is the court of general inspection, or the *censorate*, as it is called by foreigners. The mandarins composing this, number from 40 to 50; they are "the eyes and ears of the emperor;" for it is their province to see that all officers of the government, provincial or metropolitan, are faithful in the discharge of their duties. One of these censors must be present at the meetings of every one of the government boards and each is privileged to present a remonstrance to the sovereign.

The *administrative machinery* of the Chinese is very perfect in its organization, and demands an eager consideration for the right understanding of the people, and government. In each of the 18 provinces is an imperial delegate or governor, who, besides being at the head of the civil jurisdiction, is commander-in-chief, and possesses the

power of life and death for certain capital offenses. He is privileged to correspond with the cabinet-council and the emperor. Under the governor are the superintendent of provincial finances, the provincial criminal judge, and the provincial educational examiner; each communicates with his especial board in Peking. The governor is also assisted by many other judicial and administrative officials. The governmental organization of each province is complete in itself, but in a few instances two provinces — Kwang-tung and Kwang-se, for instance — form a viceroyalty, over which a governor-general, in addition to the governors, exercises authority. Every province is again subdivided into districts, departments and circuits. The average number of districts in a province is eighty, and each of these is about the size of an English county. A civil functionary, called sometimes the district-magistrate, presides over this division, and is assisted by several subordinate officers. A group of districts — six is the average number for the whole 18 provinces — forms a department, and is ruled by a prefect, who resides in the *fu* or departmental city. Three departments on an average, constitute a circuit, of which an intendant (*taoutae*) has the charge.

The several grades of mandarins, or Chinese government officials (Chinese name, *kwun-fu*), are distinguished chiefly by a different-colored ball or button on the top of the cap. There are twelve orders of nobility confined to the imperial house and clan, and also five ancient orders of nobility open to the civil and military servants of the state. The normal government of China is less a despotism than a morally supported autocracy, and it is in principle paternal. What the father is to his family, that the governor, the prefect, and the magistrate are intended to be, each in his own sphere, to the people; whilst the emperor stands in the same relation to the myriad inhabitants of his vast dominions. In ordinary times, the Chinaman enjoys much practical freedom and can travel through the country without passport, or follow any calling he likes.

The Chinese executive system is based on those noteworthy *competitive examinations*, which are intended to sift out from the millions of educated Chinese the best and ablest for the public service. The first examination takes place every three years in the capital of each department, when the lowest degree — that of bachelor — is conferred on a certain number of candidates from each district. Triennial examinations are held in the provincial capital, presided over by two examiners from Peking, at which sometimes as many as 10,000 bachelors present themselves, and compete for the degree of licentiate. Some 1200 obtain it, and these may attend the triennial metropolitan examination at Peking, when about 200 may hope for the coveted degree of doctor, which insures immediate preferment.

Mr. Meadows, the most philosophical, perhaps, of the writers on China, and from whose works the foregoing sketch of the administrative system of the country has been chiefly derived, has entered very fully into what may be termed the *philosophy of Chinese government*, which he sums up in the following doctrines, and believes them to be deducible from the classic literature of the country, and the true causes of the wonderful duration of the Chinese empire. 1. That the nation must be governed by moral agency, in preference to physical force. 2. That the services of the wisest and ablest men in the nation are indispensable to its good government. 3. That the people have the right to depose a sovereign who, either from active wickedness or vicious indolence, gives cause to oppressive and tyrannical rule. And to these he adds an institution — the system of public-service competitive examinations. But, on the other hand, these examinations, by directing the attention of students solely to the ancient literature of the country, to the exclusion of the physical sciences and inductive philosophy, however efficient in producing that wonderful homogeneity for which the inhabitants of the central kingdom are famous, stunt and stereotype the national mind, which, like the dwarfed tree the Chinaman delights to raise in a flower-pot, or the feet of a Chinese girl, can never fully expand.

Army.—Each province is provided with an army, but there are no exact statistics of the strength of these provincial forces, nor are the figures for the national forces altogether trustworthy. The latter, according to the Chinese official statistics, are divided into, 1st, the so-called *Eight Banners*, numbering 323,800 men, and including Manchus, Mongols and Chinese, and 2nd, the *Ying Ping* or national army having 6459 officers and 650,000 privates. Another classification divides the Chinese forces into — 1st, an active army consisting of (a) the army of Manchuria; (b) the army of the center; and (c) the army of Turkestan; and 2nd, the territorial army. The army of Manchuria is estimated at 70,000 men, many of whom are armed with the Mauser rifle and Krupp cannon. The army of the center is estimated at 50,000 men which can be doubled in time of war. These two are well armed. The army of Turkestan is employed in keeping order in the western territories. Its strength is not accurately known. The territorial army is a sort of militia with a possible war strength of 600,000 men.

Navy.—Before the war between China and Japan, 1894-95, the Chinese navy was supposed to be an effective fighting body, but the result of that war showed it to be ill organized and badly commanded. Directed to remain in Chinese waters, it was practically useless, and its efficiency was further impaired by the provincial system of organization. In the battle of the Yalu, one barbette armor-clad and four cruisers were sunk or burned. Afterward one armor-clad was captured and a barbette ship and cruiser were sunk. The characteristic feature of the naval organization is the division of the fleet into squadrons under the command of the provincial viceroys. In 1896-7, as a result of the demoralization caused by the late war, there was practically no effective Chinese navy. The Pei Yang squadron had but two vessels left and the southern squadron had no ships of real value. One torpedo boat, the construction of which was

ordered before the war, was added and there were in 1896, 7 cruisers of the 2nd class, 4 of the 3rd class, and between 30 and 40 torpedo boats.

Finance.—It is difficult to secure accurate data regarding the imperial revenue. A careful estimate in 1889, gave the total governmental receipts (derived from a land-tax, salt-tax and duties) as 79,000,000 taels. Other occasional sources of revenue, however, such as the sale of titles, forced loans, licenses, etc., augment the imperial income. Later estimates of the revenue by Douglass and von Brandt show an increase over 1889, the former placing it at 100,000,000 haikwan taels. The value of a haikwan tael in United States money as proclaimed by the secretary of the treasury, Oct. 1, 1896, was 80.6 cents. With the exception of the duties on foreign goods, the revenue is collected by the department treasuries, and transmitted to the government only after the deductions for local requirements. It is estimated that not more than one-third of the money collected reaches the national treasury. The Chinese government made public only that part of the receipts which is obtained from foreign customs. This increased from 7,872,257 haikwan taels in 1864 to 21,385,389 haikwan taels in 1895. A great part of the debt of China is due to the war with Japan. In 1890 the foreign debt amounted to about \$35,000,000. Extensive foreign gold and silver loans were contracted in 1894-5-6, and internal loans were also obtained. The war indemnity with Japan was 200,000,000 taels, and 30,000,000 were added as compensation for the retrocession of the Leao-tung peninsula. In 1896 the outstanding foreign debt was estimated at £38,000,000.

Religion.—The Chinese, remarkable in so many ways, exhibit, in the matter of religion, their usual eccentricity. Three forms of belief—the Confucian, the Buddhist, and the Taoist—may be considered the national religions, as they are believed in, more or less, by the great mass of the people. Of these, the Confucian and the Taoist are indigenous, but Buddhism was introduced from India. A struggle for ascendancy was long maintained between these religions, but has now entirely ceased; indeed, it is no unusual thing for all three to be professed by the same person, and as they supplement each other, this is not altogether inconsistent. Confucianism is the basis of the social life and political system of the Chinese. It has been professed by all their greatest men, and is still the sole belief of the educated classes. It is, however, less a religion than a philosophy, and does not pretend to treat of spiritual things; hence room was left for other creeds to supply its deficiencies in this respect. The questions to which Confucius replied were: "How shall I do my duty to my neighbor? How can I best discharge the duty of a virtuous citizen?" Funereal temples are erected to Confucius, and though his image is not used as an idol, his tablet is worshiped, and sacrifices of oxen and sheep are offered before it at the vernal and autumnal equinoxes. For an account of Confucius's philosophy, see CONFUCIUS.

Buddhism in China, though extending over the whole country, and influencing more or less the mass of the people, is fast losing its hold on them, and has very little of the power and authority it once possessed. Its edifices are going to decay, and no new ones rise upon their ruins. Its priests are illiterate, and together with their religion, are held in contempt by the philosophic Chinaman. Aged people and women are now its chief devotees. The begging-monk is characteristic. He wears a loose yellow robe and large stockings; at his back is a wallet in which to receive the contributions of the faithful; and he gives notice of his approach by striking his *muh-yu*. The northern form of Buddhism, which differs considerably from that of Ceylon and the Indo-Chinese peninsula, prevails in China. Its sacred books, in common with those of Nepal and Thibet are written in Sanscrit, or are translations from that language. Amongst other additions to the creed are the western paradise and the goddess of mercy.

Taoism has not more hold than Buddhism on the literate Chinese. Its priests are generally ignorant men, few of them teaching or understanding the real principles of their faith. They practice a mystic alchemy, prepare spells and incantations, and like modern spiritualists, hold intercourse with the dead. When all other remedies have failed with a sick person, the Taoist priests are sometimes sent for to exorcise the evil spirit that is supposed to afflict the patient; and they chant prayers from their mystic ritual, amid the din of gongs, drums, flutes, etc. These mystics worship certain stars, which are supposed to influence human life, and also genii, devils, and inferior spirits. They live in temples with their families, and are known by their slate-colored robes. For a fuller account of Taoism and its doctrines and founder, see LAOU-TSZE.

Besides these three religions, which alone affect the bulk of the people, there is a *ritual state worship*, which regards the emperor and court alone—a kind of philosophic pantheism, an adoration of certain natural objects; but it is a mere ceremonial, and associated with no theological doctrines. Three classes of objects are distinguished, to which the great, medium, and lesser sacrifices are offered. The first-class includes the heaven and earth. Equal to these, and likewise restricted to the worship of the emperor, is the great temple of imperial ancestors. The medium sacrifices are offered to the sun and moon, the gods of the land and grain, genii, and sages. In the third class are reckoned certain natural phenomena, as well as deceased statesmen and scholars. The emperor appears to acknowledge a supreme Being as king of kings, the rewarder of virtue and the punisher of vice; but still, Chinese philosophy, as fixed by Chu-tze, is atheistical, and deduces "the development of the universe from one unintelligent and will-less principle." Hence all educated Chinese are atheists, at least theoretically, as will be found by arguing with them; but when they speak of human affairs generally, and their own particular lot in life, they exhibit a belief in *teen* as a supreme, intelligent, rewarding, and punishing power. There are besides about 300,000 Mohammedans.

Between the followers of the three national religions there is not only a total absence

of persecution and bitter feeling, but a very great indifference as to which of them a man may belong. It arises probably from religious apathy; yet still it is preferable to the fanatical zeal and cut-throat earnestness of the Moslem. Amongst the politer classes, when strangers meet, the question is asked: "To what sublime religion do you belong?" and each one pronounces a eulogium, not on his own religion, but on that professed by the others, and concludes, with the oft-repeated formula: "Religions are many; reason is one; we are all brothers." The government is equally tolerant of religious diversity, except where a political design is suspected.

Temples belonging to the three religions are very numerous. Those dedicated to Confucius are funeral in character. The Buddhist temples are crowded with images, and Buddha is represented expounding his doctrine to attentive listeners. The many-storied tower takes the place of the bell-shaped dagoba or relic-shrine of other Buddhist countries.

History and Foreign Intercourse.—The early annals of China, like those of most other countries, belong rather to mythology than to history. Beginning with Pan-ku, the first of all beings, the country was ruled over first by gods, and then god-descended personages, who revealed to men the essential arts of life. Of those mythical rulers the most famous is Fo-hi. The historical period may be said to commence with the Hsia period or dynasty, begun by Yu the great about 2200 B.C., although a great infusion of the fabulous still continues. Some date the real history of China from the Tchou or Chow dynasty, which began with Wu-wang about 1100 B.C. It was during the reign of Ling-wang (571–544), one of this dynasty, that Confucius was born. China would seem during this period to have been divided into a number of independent states. The kings of Tsin gradually gained the ascendancy, and at last one of them reduced the other states to subjection (247 B.C.), and assumed the title of Hoang, or emperor. It is from the Tsin dynasty that the country has taken its name, Tsina or China. This first emperor finished the great wall (see above), as a protection against the Tartars, who had all along, under the name of Hiong-nu (Huns), been a source of danger and annoyance to the richer and more pacific Chinese. We cannot enumerate the various dynasties that followed, nor the frequent divisions and reunions of the empire, varied by incursions and partial subjugations by the troublesome Tartars. At last, the Mongols or western Tartars, being called in to aid the Chinese (1209), became finally (see KUBLAI KHAN) masters of the whole country (1279), and reigned over it till 1368, when they were expelled by the Chinese, and the Ming native dynasty succeeded, which lasted 276 years, and fell at length through its own misgovernment. A general of the last Ming emperor, employed in keeping the Manchus (see MANTCHURIA) in check, made peace with them, and obtained their assistance against the native usurper who had deposed his sovereign. The Manchus established themselves in Peking (1644), and finally, after a seven years' struggle, acquired the sovereignty of the whole empire. Many of the conquering race now filled the highest offices of state, and owed their position to birth alone. More than one powerful emperor of the race has ably conducted the government of the country; but Hien Fung, who ruled from 1850 to 1861, was reported to have passed his time in a state of drunken imbecility. The late emperor, Tung-chi, succeeded to the throne when only a child five years old, but the government was ably carried on under the co-regency of the empress-dowager, Tze-an, the empress-mother, Tze-sse, and the enlightened prince Kung, brother of Hien Fung. Tsai-Tien, cousin of Tung-chi, ascended the throne in 1875. As he was then only about four years old, the empresses continued to act as regents.

Of recent events in Chinese history, the most remarkable is the rise, progress, and overthrow of the Tae-ping rebels. Their famous leader, Hung-sew-tseuen, was a man of humble origin, and an unsuccessful candidate for government employment. Some Christian tracts, it is said, led him to renounce idolatry, and he founded a society of God-worshippers, which, in the autumn of 1850, was brought into collision with the imperial authorities, and immediately assumed a political character. Hung persuaded himself and his followers that he had received a divine commission to uproot idolatry, extirpate the Tartar intruders in the country, and establish the new native dynasty of Tae-ping, or universal peace. He assumed the title of heavenly or divine prince (Tae-ping-wang, sometimes called Tien-wang), and bestowed the titles of eastern prince, western prince, southern prince, northern prince, and assistant prince on five of his chosen leaders. The fanatical principle of divine revelations and other extravagances followed. They spoke of Tien-na, the wife of the Heavenly Father; they held that Tien-wang was the son of God as really as Jesus, and worshiped him accordingly. Polygamy was a dark feature of their system, the Tien-wang himself having married 30 wives. The course of this religio-political rebellion, the victorious march of the Tae-ping army from Kwang-se to Nankin in 1850–53, and its subsequent career, cannot here be traced. We can only afford room to state, that after a series of wasteful and revolting barbarities, it was finally suppressed in 1865 by the imperial troops, led by British and American officers, of whom the most conspicuous and able was col. Gordon. See TAE-PINGS.

In early times, the Chinese do not appear to have been opposed to intercourse with foreigners; but the conduct of the Spaniards and Portuguese between 1520 and 1570 excited their hostility. The Manchu government restricted British trade and intercourse to Canton, where it was carried on through the medium of the *hong* merchants on the one side, and the East India company on the other. Differences arose, however, from time to time between these two commercial bodies, occasioned chiefly by the ex-

tions of the mandarins on foreign trade. With a view to a better understanding, the British government despatched to Peking an embassy under Lord Macartney in 1792, and another under Lord Amherst in 1816. On the 22d April, 1834, the monopoly of the East India Company ceased, and British imperial officers were appointed to carry out the new judicial and fiscal arrangements. Constant dissensions between these and the mandarins continued till the end of the year 1839, when the latter, under pretense of stopping the opium trade, committed acts of open hostility. A war broke out the following year, at the commencement of which Chinese officials talked of invading England overland, by way of Russia. The imperial government was, however, sufficiently humbled by the middle of the year 1842, and on the 29th Aug., a treaty of peace was signed before Nanking, by which the ports of Amoy, Fu-chow, Ning-po, and Shanghai were, in addition to Canton, thrown open to foreign trade. The island of Hong-kong was ceded to Great Britain, and an indemnity of \$21,000,000 promised by the Chinese.

With five free ports, British trade with China soon assumed gigantic proportions; and though the Chinese evaded the treaty whenever practicable, no important event occurred to interrupt commercial intercourse till 8th Oct., 1856, when the authorities at Canton seized the crew of the lorcha *Arrow*, a vessel registered at Hong-kong, and entitled, it was considered, to British protection. Under pressure from the British forces at hand, the imperial commissioner, Yeh, delivered up the men, but refused all apology. Yeh continuing obstinate, Canton was stormed (Dec. 28, 1857) by the allied French and English forces, and the Chinese imperial commissioner captured (Jan. 5, 1858). The government of the city was still carried on by Chinese officials, but under the authority of the plenipotentiaries and commander-in-chief. The former now proceeded to the n. of China, to put themselves in more direct communication with the imperial government, which still continued obstinate. The forts at the mouth of the Peiho were taken (May 20, 1858), and at length an important treaty was signed at Tientsin, June 26, 1858, which stipulates that the queen of Great Britain may (art. ii.) appoint diplomatic agents to the court of Peking, who (art. iii.) shall be allowed to reside at the capital, where also her majesty may acquire a building site. The Christian religion (art. viii.) shall be protected by the Chinese authorities.

By this treaty, the vexed question of transit-dues is settled, it being agreed that the British merchant may purchase at the rate of 2½ per cent *ad valorem*, in the case of imports at the port of entry; and in the case of exports, he may purchase a certificate enabling him to pass his goods, duty-free, to the port of shipment. By a separate clause, the Chinese government agreed to pay two million taels (about £650,000), as indemnity for losses sustained by British subjects at Canton, and a like sum towards the expenses of the war.

The repulse on the Peiho (June, 1859), by a Tartar force concealed in the Taku forts, of the expedition forming the escort of the British and French ambassadors, who were on their way to Peking, to ratify with the emperor of China the treaty of Tientsin, entailed another costly demonstration in the Chinese waters. The Taku forts were captured by the allied English and French forces, Aug. 21, 1860, and Peking itself in Dec., 1860. The treaty of Tientsin was ratified, two additional articles being inserted, one of which legalized coolie emigration. Since 1861, a gradual but beneficial change has come over the spirit of the Chinese government. Prince Kung proved a vigorous and successful regent. The army has been reorganized, and is now subjected to European drill (see *par. army*); a respect for the observance of treaties has sprung up; a national flag has been adopted, and a desire shown on the part of the Chinese to make themselves acquainted with international law. In 1866, arrangements were begun for telegraphic communication between Peking and the rest of the world; and emigration to all other countries was allowed. Shanghai has telegraphic communication with Europe, and some local lines. A railroad between Lutai and Taku was opened in 1888 and two on the island of Formosa. Chinese are now found on almost every shore of the Pacific, where their industry, skill, and sobriety secure them abundant employment. They are especially numerous in the Pacific states of the American Union, where harsh measures, at first including a heavy tax on arriving, were adopted, and later, acts tending to exclude them altogether were passed. In 1894, the conflicting interests of China and Japan in Corea (which was nominally a vassal of China) led to a war between these two great Oriental empires. Hostilities began July 25, six days in advance of the formal declaration of war by Japan; when a Japanese squadron defeated a Chinese fleet and sank a transport carrying troops, and terminated in May, 1895, when, after the invasion by the Japanese of Manchuria, China was forced to make peace to avoid the impending capture of Peking. The terms of the final treaty included the recognition by China of Corea's entire independence, and the payment by China to Japan of a war indemnity of 200,000,000 taels, and an additional 30,000,000 for regaining the Leao-tung peninsula. The effects of the war on trade were felt in 1895 and 1896, the tea trade showing the greatest depression. In Oct. 1896 the plan for the Siberian railway across northern Manchuria was decided upon. For an account of Li Hung Chang's tour of the world in that year see the article **LI HUNG CHANG**. See also **COREA**; **JAPAN**.

Commerce and Internal Communication. — The rivers and numberless canals of China are covered with vessels of all sizes, employed in the internal commerce of the empire. The Chinese are devoted to traffic, and the Middle Kingdom is throughout its length and breadth a perpetual fair. In 1876-7 a short railway line was constructed and purchased by the Chinese government. Later a line was built connecting the Kai-ping

mines with the river Petang and this was afterward continued to Tien-tsin, and Lin-si. In 1889 the government constructed a railway across the n.w. part of China. Imperial telegraph lines have been rapidly extended and the chief cities of the empire are connected with each other and with Peking. In March 1896, an imperial edict was issued for the creation of a national post-office on western models. The value of China's foreign trade in 1895 was, imports 171,696,715 haikwan taels, and exports 143,293,211 haikwan taels. In the same year the greater part of the Chinese foreign trade was with Great Britain and Hong Kong. Next in importance came Japan, United States, India and Russia. The chief exports were, in order of importance, silk, raw and manufactured tea, straw braid, clothing, sugar, paper, china ware and pottery, and hides, but of these the two first constitute by far the greater part of the exports. Of imports, cotton goods and opium are the chief. During the year 1895 the total number of vessels entered and cleared at Chinese ports was, 37,132, with a tonnage of 29,737,078, of which 19,579 vessels with a tonnage of 20,525,798 were British. The collection of foreign customs is under the management of an imperial customs department, which employs a large staff of European, American and Chinese officials.

There is no *coinage* in China except the copper *tchen*, or "cash," which is in value about the tenth of a cent, or a mill; and all but the most trifling payments are made by a certain weight of silver, or in Mexican or Spanish dollars. Chinese accounts are kept in taels, mace, candareens, and cash.

The following works (which have been used as authorities in the preparation of this article) may be consulted for further information on China. Meadows's *Chinese and their Rebellions* (Lond. 1856); Davis's (sir J. F.) *China: a General Description of that Empire* (Lond. 1857); Davis's *China during the War and since the Peace* (Lond. 1852); Williams's *Middle Kingdom* (revised ed., New York, 1883); Oliphant's *Narrative of the Earl of Elgin's Mission to China and Japan, in the years 1857, 1858, and 1859* (Edin. 1859); Marquis de Mages's *Recollections of Baron Gros's Embassy to China and Japan in 1857 and 1858* (Lond. 1860); Huc's *Chinese Empire* (Lond. 1858); Cooke's *China in 1857 and 1858*; Fortune's *Three Years' Wanderings in China* (Lond. 1847); Fortune's *Visit to the Tea Districts of China* (Lond. 1852); Edkin's *Religious Condition of the Chinese* (1858); Cobbold's *Pictures of the Chinese by Themselves* (1859); *Twelve Years in China, by a British Resident* (1860); *Mémoires sur la Chine* (1869); Rev. A. Williamson's *Journeys in North China, etc.* (1870); Freiherr von Richthofen's great work, *China* (1877-1880); Boulger's *History of C.* (1881-1884); Douglas, *Society in China* (1894); and Norman, *Peoples and Politics of the far East* (1895).

CHINESE EDIBLE DOG. The kind of dog used as an article of food in China, and reared in order to be so used, being esteemed as a delicacy, is a small dog of greyhound-like form, with somewhat terrier-like head, and muzzle more elongated than in terriers. It is fleet and active, gentle and affectionate. The skin is almost destitute of hair; but one variety has a crest of hair on the head, and a tuft of hair at the tip of tail.

CHINESE IMMIGRATION. See EMIGRATION AND IMMIGRATION.

CHINESE INK. See INDIAN INK.

CHINESE LANGUAGE, WRITING, AND LITERATURE. The Chinese language belongs to those Asiatic languages commonly called monosyllabic, because each word is uttered by a single movement of the organs of speech, and expresses in itself a complete idea or thing. All Chinese words end either in a vowel, a diphthong (in which, however, each vowel sound is distinctly pronounced, making the word often to appear of more than one syllable), or a nasal. Of such simple words or roots there are about 450. But the emphasis or accent of many of these words may be varied by the speaker in four or five different ways, so as to produce a corresponding variety in their meaning, by which means the number of simple words or roots amounts to about 1200. There is no distinction of parts of speech in the Chinese language, and no recognition of the principle of inflection, Chinese words being incapable of any modification of *form*. The relations of words are ascertained by their position in a sentence. Hence Chinese grammar is *solely* syntax. Thus *ta*, according to its position in a sentence, at one time serves the purpose of an adjective, meaning "great;" at another, a substantive, meaning "greatness;" and again of a verb, meaning "to enlarge" and "to be great," or of the adverb "very." There are certain words, however, which have at length lapsed into so vague and general a signification, that in conversation and literature they are now used in some cases as particles to determine the relations of other words; but in the older literature this is very rare, and is against the genius of the language. From what has been said, it will readily be inferred that the gender, number, and case of words are not determined by the *form* of the words themselves. They are, in fact, denoted by the addition of other words. Thus, *people* in Chinese is *multitude man*, *son* is *man child*, *daughter* is *woman child*. *The best of men* is in Chinese *a hundred man good*. The purest Chinese is spoken at Nankin, but the same idiom, called "the language of the mandarins," is spoken by the educated in all parts of the empire. For a knowledge of Chinese grammar, see Schott's *Chinesische Sprachlehre* (Berlin, 1857); Summers's *Handbook of the Chinese Language* (1863); Julien, *Syntaxe Nouvelle de la Langue Chinoise* (Paris, 1870); Morrison's *Dictionary of the Chinese Language* (Shanghai, 1865).

In Chinese the written character, generally speaking, does not indicate the sound of the word, but gives a kind of hieroglyphic or pictorial representation of the idea or thing to be expressed. Hence there are required as many of these characters or symbols as there are ideas to be represented. Since many words similar in sound are different in signification, whilst in writing each idea has its peculiar symbol, the number of words represented by writing—without reckoning those peculiar to certain dialects—is perhaps ten times greater than those distinguished by the ear. The number, in fact, is reckoned at 50,000, but these are far from being all in general use. In writing and printing, the characters are arranged in perpendicular columns, which follow one another from right to left.

In its origin, Chinese writing is hieroglyphic or picture-writing, with the addition of a limited number of symbolical and conventional signs; the larger number of Chinese characters are formed by the combination of such hieroglyphs and signs. But as one such character by itself seldom determines the sound, an additional word is conjoined for this purpose; so that the great mass of Chinese written words consist of an ideographic and a phonetic element. Native grammarians divide their characters into six classes. The first class comprises simple pictorial representations of sensible objects, such as sun, moon, mountain, etc., and contains 608 characters. The second class includes such characters as are formed by the combination of two or more simple hieroglyphs, which together convey, in a more or less intelligible manner, some other idea: for example, the hieroglyph for sun, combined with that for moon, conveys the idea of light; mouth and bird, that of song, etc.; of these there are 740. The third class embraces those characters which indicate certain relations of position, as above, below, the numerals, etc.; of these there are 107. The fourth class consists of characters which, by being inverted, acquire an opposite signification, as right, left, standing, lying, etc., and contains 372. The characters of the fifth class are termed derived characters; the meaning of the simple or compound characters used to express physical objects, is transferred to mental objects, or to other physical objects with which they are associated, e. g., the hieroglyph for a heart signifies the soul—that for a room, signifies the wife, etc.; of these there are 598. The characters of the sixth class include those which are composed, as above mentioned, of sign and sound. Almost all names of plants, fishes, birds, and many other objects which it would be difficult to represent hieroglyphically, are denoted by the compound characters of the sixth class, which amount to 21,810 in number. As this class, however, consists merely of repetitions of the other five classes, the immense number of Chinese characters may be reduced to 2,425; and whoever learns these may be said to know them all.

The hieroglyphical characters in their oldest form were easily recognizable figures: thus, the hieroglyph for sun was as in the fig. at *a*; for moon, as at *b*; for light, a combination of sun and moon, as at *c*; for to listen, folding-doors and an ear, as at *d*; for white, a very squint eye, in which hardly anything but the white is seen, as at *e*; for friends, the two valves of a bivalve shell, as at *f*. In the course of time, through hasty and careless tracing, the objects denoted by the hieroglyphs have almost ceased to be recognizable. The modern hieroglyphs corresponding to the above are as represented at *a'*, *b'*, *c'*, etc. See Abel Rémusat's "Mémoire sur l'Écriture Chinoise," in the *Mémoires de l'Académie des Inscriptions*, vol. viii.; and for a view of the Chinese characters, both ancient and modern, Hager's *Monument de Yu* (Par. 1802).

The Chinese literature, in a geographical, ethnographical, and historical point of view, is unquestionably the most comprehensive and important of the whole of Asia. The printed catalogue of the emperor Kien-long's library is composed of 122 volumes; and a selection of the Chinese classics, with commentaries and scholia, which was begun by the order of the same emperor, is said to comprise 180,000 volumes, of which, in the year 1818, 78,731 volumes had already appeared. In the five canonical or classical books, called *King*, are contained the oldest monuments of Chinese poetry, history, philosophy, and jurisprudence, some portions of which belong, perhaps, to the most ancient writings of the human race. Confucius (q.v.), in the 6th c. B.C., collected them from various sources, and in this collection they have been pretty faithfully handed down to us. Next to these in value are the *Sse-shu*, or the four books. These, as they were written by Confucius and his disciples, must be regarded as the most trustworthy source of insight into the intellectual and political life of the Chinese. A complete and elaborate edition of the five *King* and the four *Shoo* has been undertaken by the great English Sinologue, Dr. Legge, under the title of "The Chinese Classics, with a translation, critical and exegetical notes, prolegomena, and copious indexes. In seven volumes;" of which five vols. appeared between 1861 and 1878. A popular edition, under the title of "The Chinese Classics translated into English," has also been published, of which vols. i. and ii. deal respectively with the "Life and Teachings of Confucius" and the "Works of Mencius." Almost contemporary with Confucius lived Lao-tse (q.v.), who was born 604 B.C. He was the founder of a school of philosophy, more spiritual in its character than that of Confucius, but which has

Chinese Characters.

now degenerated into the lowest and most vulgar kind of demonology; see *Le Livre de la Voie de la Vertu*, Chinese and French, by Julien (Par. 1842). In mythology, the Chinese have *The Book of the Mountains and Seas*, *The History of the Gods and Spirits*, and some others. In jurisprudence may be mentioned the universal collection of laws, and the criminal code of the present dynasty; see *Ta-Tsing-lu-li, being the Fundamental Laws and Supplementary Statutes of the Penal Code of China*, by Staunton (Lond. 1810). The Chinese literature is also very rich in works on medicine, natural history, astronomy, agriculture, military science, music, and all branches of mechanics and industry; see *Résumé des principaux Traités Chinois, sur la Culture des Mâriers et l'Education des Vers-à-soie*, by Julien (Par. 1837). In philology, the most valuable works are the dictionaries, in which the Chinese characters have been collected and elucidated by examples from the whole treasury of Chinese literature; but the greatest of all works of this kind is the dictionary of the emperor Kang-hi, which is now regarded as the highest authority for the pronunciation and meaning of the characters. Of the encyclopædias of the Chinese, the most conspicuous are that by Ma-tuan-lin (1300 A.D.), called *Wen-hien-thong-khau*—i.e., an accurate investigation of the ancient documents, with rich supplements; and the *Koo-kin-too-shoo-tsei-ching*, or *Complete Collection of Ancient and Modern Books*—of which latter vast work a copy was secured for the British museum in 1877. But the most valuable portions of the Chinese literature are, undoubtedly, their historical and geographical works, which are indispensable to a knowledge of Upper Asia. Sse-ma-thsian (100 B.C.) compiled, from every recognized authority, a work called *Sse-ki*, or historical memorials, which embraces the history of China from the year 2637 B.C. up to the commencement of the dynasty of Han in the 2d c. B.C. This work has been continued by the different dynasties, and forms a complete collection of the annals of the empire up to the termination of the Ming dynasty in 1643 A.D. It is known under the title of *Nian-eul-sse*, or the 22 histories. The entire collection of the official annals from 2698 B.C. to 1645 A.D., comprising a period of 4343 years, and consisting of 3706 books, is to be found in the library at Munich.

Amid all their scientific labors, the Chinese have not neglected the art of poetry, in which they possess voluminous collections that have yet to be made known to Europe. In lyrical poetry, the most distinguished names are Li-thai-pe and Tu-su, both of whom flourished at the beginning of the 8th c. A.D.; see Davis "On the Poetry of the Chinese," in the *Transactions of the Royal Asiatic Society*, vol. ii. The romantic poetry of the Chinese, although void of poetic beauty, is valuable for the insight it gives into their domestic life. Their dramatic poetry has laws peculiar to itself, and resembles partly the romantic drama of the Germans, and partly the *comedia delle arte* of the Italians. They have also a kind of novel in dialogues, which forms a subordinate species of drama. Besides the speaking persons or actors, there is what they call a singing person, who introduces into the piece songs which he sings to popular melodies, and appears to correspond in a rude way to the Greek chorus. The best collection of works in this species of literature is the *Yuen-dschin-pe-tschong*, i.e., the hundred dramas from the Mongol dynasty (1260-1341), from which all the Chinese dramas known to Europeans have been taken. A Chinese novel, affording a graphic view of the tastes and literary views of that people, was some time ago placed within the reach of European readers by the eminent Chinese scholar Stanislas Julien, under the title of *Les Deux Jeunes Filles Lettrées* (Par. 1860). English readers may also obtain instructive pictures of Chinese life from *Iu-kias-li*, or the Two Fair Cousins, translated from the French version of Rémusat in 1827; and *The Flowery Scroll*, translated, with numerous learned notes, by sir John Bowring, in 1868. But valuable sketches will be found in Schott's *Chinesische Sprachlehre* (1857), Davis's *Chinese Miscellanies* (1865), and Wylie's *Notes on Chinese Literature* (Shanghai, 1867).

CHINESE SEA, or CHINA SEA, that portion of the Pacific ocean which has China and Siam on the w., the island of Formosa, on the n., the Philippines on the e., and Borneo on the s., and which forms the great gulfs of Tonquin and Siam.

CHINESE WHITE. The white oxide of zinc has recently been introduced into the arts, under this name, as a pigment in place of the preparations of white-lead. It changes very little either by atmospheric action, or by mixing with other pigments; but it has not the body of white-lead.

CHINGLEPUT, or CHENGALPAT, the name of a district in India and of the principal town in that district. The district is in the presidency of Madras and has an area of 2842 sq. m. with a pop. in 1891 of 1,137,000. It has about 120 miles of coast, but is ill provided with harbors. Nor is its internal navigation of great value, the only considerable river being the Palar, or Palaur. The town is situated 36 miles s.w. of Madras, and contains a fort built toward the end of the 16th century and now abandoned as a military station. It was captured by Clive from the French in 1752 and besieged by Hyder Ali in 1780-81. Pop. about 6200, 5,800 being Hindoos.

CHINGTU, a departmental town in China, capital of the province of Sze-chuen, situated in the middle of a fertile plain watered by several streams. It is connected by telegraph with Hankow and maintains considerable trade in furs, rhubarb, musk, medicines, etc., for which tea, silk and cotton cloth are exchanged. The streets are well laid out and clean, and the houses are well built. Pop. is estimated at 800,000.

CHINI, a village of the Punjab, about a mile from the right bank of the Sutlej, the

most easterly of the five rivers which give name to the country. It is in lat. $31^{\circ} 31' N.$, and long. $78^{\circ} 19' E.$, and is 8,770 ft. above the sea. Notwithstanding this elevation, it is a delightful place of sojourn, and was a favorite residence of Lord Dalhousie. It occupies a slight depression on the southern slope of a lofty mountain, which fertilizes the soil with a network of never-failing rills. The neighborhood is remarkable for the size and flavor of its grapes, while the vines, trained over horizontal lattices, afford, while in foliage, a tolerably continuous shelter.

CHIN-INDIA, or **FARTHER INDIA**. See **SIAM**, **BURMAH**, **COCHIN CHINA**.

CHIN-KEANG-FOO ("River-Guard City"), a Chinese city and port on the Yang-tze-kiang, at the junction of the grand canal with that river, and about 150 m. from its mouth, was opened to European commerce by the treaty of Tien-tsin (1858), and a British settlement was begun in 1864; and though its trade developed slowly at first, it has become one of the most important centres of foreign trade in China, the principal articles of export being silk, rice, dried lily-flowers, etc.; of import, opium, cottons and sugar. Natural and artificial water-ways connect it with Shanghai, and its site is very favorable to commerce. It contains a curious cast-iron pagoda 30 ft. high, thought to be 1200 years old. During the Tae-ping rebellion its population was greatly reduced. Pop. '90, about 135,000.

CHINNOR, a musical instrument of the ancient Hebrews, with 32 strings.

CHINON, a t. of France, in the department of Indre-et-Loire, beautifully situated on the Vienne, 25 m. s.w. of Tours. It has the remains of a huge old castle, formerly the occasional residence of the Plantagenet kings of England, and also of some of the French sovereigns, and celebrated as the place where Joan of Arc commenced her historical career, and as the birthplace of Rabelais. C. has manufactures of druggets, serges, earthenware, etc. Pop. '91, 6119.

CHINOOKS, Indians of n.w. North America who once inhabited the region around the Columbia river, in Oregon. They are now nearly extinct. The term Chinookan is applied to a linguistic stock which is divided into the Lower Chinook and the Upper Chinook branches. In general it included the fishing tribes of the n.w. coast. The representatives of this stock are very few in number, and are to be found chiefly on the reservations in Oregon and Washington.

CHINQUAPIN. See **CHESTNUT** and **OAK**.

CHIN'SURA, a t. on the right bank of the Hooghly, about 20 m. above Calcutta, in lat. $22^{\circ} 53' N.$, long. $88^{\circ} 23' E.$ Pop. along with Hooghly, '91, 33,100. It contains the Hooghly college, and is considered one of the healthiest places in Bengal. It was originally a Dutch settlement, but was ceded in 1824 to the British, along with some other places on the mainland, in exchange for the English possessions in the island of Sumatra.

CHINTZ, a highly glazed printed calico, with a pattern in many colors on a white or light colored ground. It is chiefly used for bed-hangings, for covering furniture, and other purposes where gay colors are desired, and where there is much exposure to dust, which does not adhere to its highly calendered surface. See **CRETONNE**.

CHIO. See **SCIO**.

CHIOCOCCA, a genus of tropical and sub-tropical plants, of the natural order *cinchonaceae*, of which two species in particular, *C. anguifuga* and *C. densifolia*, the former a trailing herb, and the latter a bushy shrub, enjoy a high reputation in their native country, Brazil, as cures for snake-bites. An infusion of the bark of the root is certainly one of the most violent emetic and drastic medicines known, its action being accompanied with spasmodic agitations of the whole frame and other symptoms, such as to preclude its use except in the most extreme cases. Yet it had at one time a high reputation in Europe, and was administered in small doses as a diuretic and purgative.

CHIOGGIA, or **CHIOZZA**, an important commercial t. and seaport of northern Italy, in the province of Venice, stands on an island of the same name in the Adriatic, and is connected with the mainland by a stone bridge of 43 arches. The pop., amounting to about 27,100, are chiefly engaged in the coasting-trade, in lace-making, and in ship-building.

CHION, OF **HERACLEA**, one of Plato's pupils, who sought to liberate his native city by slaying the tyrant Olcrachus, but the friends of the tyrant slew the conspirators and the oppression of the people became still greater.

CHIONIS and **CHIONIDÆ**. See **SHEATH-BILL**.

CHIP HATS. See **BRAZILIAN GRASS**.

CHIPMAN, **DANIEL**, LL.D., 1765-1850; brother of Nathaniel; educated at Dartmouth college and began law practice in Vermont in 1790. He was a member of the legislature and of congress, and professor of law and jurisprudence in Middlebury college from 1806 to 1816. He was the first official reporter of the decisions of the supreme court of the state, and the author of *An Essay on the Law of Contracts for the payment of Specific Articles*.

CHIPMAN, **NATHANIEL**, LL.D., 1752-1843; a native of Connecticut, educated at Yale, served as a lieutenant in the revolutionary army, and was present at the battle of Monmouth. He was admitted to the bar in 1779, and began practice in Vermont, where he became chief-justice of the state. In 1791, he was a member of the convention called

to decide whether Vermont should join the union, and was one of the commissioners to arrange for the state's admission. Washington appointed him judge of the U. S. court for the district of Vermont. In 1797, he was chosen U. S. senator, and in 1813, he was again elected chief-justice of the state. He was afterward for 27 years professor of law in Middlebury college. Among his published works are *The Sketches of the Principles of Government*; a volume of *Reports and Dissertations*; and *Principles of Government—a Treatise on Free Institutions, including the Constitution of the United States*.

CHIPMUNK, the common name of the ground squirrel, *tamias striatus*, especially in the New England and northern states. See **SQUIRREL**.

CHIPPENDALE FURNITURE is a particular style of light and elegant drawing-room furniture, inlaid with colored woods, made by Thomas Chippendale, a celebrated English cabinet-maker and designer of furniture, who, in the year 1752, was in business in St. Martin's Lane, London. Almost all mahogany furniture of the last century is popularly known as Chippendale. Chippendale's designs are delicate and elaborate, though perhaps somewhat overwrought. In 1752, he published a book of designs for furniture drawn by himself. Of this work a second edition appeared in 1759, and a third in 1762. John Weale in 1858-59 issued an elaborate volume entitled *Chippendale's Designs for Sconces, Chimneys and Looking Glass Frames in the Old French Style*.

CHIPPENHAM, a parliamentary and municipal borough in Wiltshire, in a valley on the left bank of the upper part of the Bristol Avon, on the Great Western railway, 22 m. e. of Bristol. It consists chiefly of a well-built street above half a mile long. A bridge of 21 arches crosses the Avon here. C. is famed for its markets of cheese and corn, its cheese market being one of the largest in Britain. There are silk and woolen manufactures, and some mineral springs in the vicinity. Population of borough (1891), 4,618. It returned one member to parliament till 1885. C. was the seat of the Saxon kings of Wessex. About 880, the Danes took it from Alfred, and kept it two years.

CHIPPEWA, a co. in n.e. Michigan, on lakes Huron and Superior and the straits of Ste. Marie; 1606 sq. m.; pop. '90, 12,019. The surface is hilly, and mostly covered with pine forests. Co. seat, Sault Ste. Marie.

CHIPPEWA, a co. in s.w. Minnesota, on the Minnesota, Chippewa, and Chetomba rivers, reached by the Chicago, Milwaukee, and St. Paul railroad; 575 sq. m.; pop. '90, 8555. Productions, almost entirely agricultural. Co. seat, Montevideo.

CHIPPEWA, a co. in n.w. Wisconsin, on the head-waters of the Chippewa river; 1980 sq. m.; pop. '90, 25,143. The surface is varied, and to a great extent covered with forests. Lumbering is the chief business. Co. seat, Chippewa Falls.

CHIPPEWA, a village and port of entry in Ontario, Canada, at the junction of the Chippewa with the Niagara river, 2 m. above the great falls. It was here that Gen. Brown defeated the British, July 5, 1814. The Americans had 1900 men, of whom 68 were killed and 267 wounded; the English had 2100 men, of whom 138 were killed and 365 wounded. Pop. '91, 523.

CHIPPEWA RIVER, in Wisconsin, rising in the n.w. part of the state and emptying into the Mississippi just below lake Pepin. Its length is about 200 miles.

CHIPPEWAYS. See **INDIANS**.

CHIPPING BIRD, or **CHIPPING SPARROW**, *Spizella socialis*, a common American bird, 5 or 6 in. long, white underneath, back and sides ash color, with stripes of black and white. Its half-dozen notes of song are repeated with great rapidity.

CHIQUECHIQUE PALM, *Leopoldinia piassaba*, the **PIASSABA** of the n. of Brazil, and one of the palms which yield the piassaba (q.v.) fiber, now so much used for making brushes. The piassaba fiber exported from Pará is all obtained from it. It grows in swampy or occasionally flooded lands on the banks of the Rio Negro and other rivers of Venezuela and the n. of Brazil; and has a crown of very large, regularly pinnate leaves, with smooth slender stalks. The leaves, like those of many other palms, are much used for thatching.

CHIQUEMULA, **ISTHMIUS** OF, in Central America, to the s.e. of the peninsula of Yucatan, in long. 89° west. Its breadth from the Caribbean sea to the Pacific is about 150 m.—the greatest elevation not exceeding 2,000 feet.

CHIQUEMULA, a department of Guatemala, running from the Caribbean sea along the Honduras border; 4,000 sq. m.; pop. between 60,000 and 70,000. The river Motagua runs through the middle of C. and empties into the gulf of Honduras at San Tomas de Castillo, one of the best ports in Central America.

CHIQUETOS, a nation of Indians once very powerful in South America, inhabiting the region w. of Paraguay river. Early explorers described them as an intelligent, warlike, and independent people, living in families, subsisting by agriculture and by the chase, very numerous, and having ample material resources. The Spaniards first invaded their country in 1525, and there were frequent wars with little advantage to the whites. The first permanent white settlement among them was not effected until 1691, when a Jesuit mission was established. The missionaries soon obtained great influence over them, and agriculture and arts prospered, and a considerable trade grew up with the adjoining Spanish settlements. The missions were prosperous until the expulsion of the Jesuits in 1767. Thereafter the Indians rapidly deteriorated, and within a third

of a century following the abandonment of the missions two thirds of the C. nation had disappeared.

CHIRA'TA, **CHIRETTA**, or **CHIREETA** (*agathotes chirayta*, also known as *Ophelia chirata*), an officinal plant belonging to the natural order *gentianee*, and possessing properties similar to those of the common gentian, the centaury, and other plants of that order. It is a native of the mountains of the n. of India. The whole plant is intensely bitter, and has been long used in its native country as a tonic and stomachic.

CHIRICAHUA INDIANS, a tribe of North American Indians belonging to the Apache family. In 1883, the C. made trouble among the settlers in Arizona and New Mexico and were subdued by General Crook, after a prolonged campaign. They were then placed on the San Carlos reservation, under a government half-civil and half-military, the agency supplying their wants and the military acting as police. The C. are a brave race, whose boast had been that they had never bowed to civilized power.

CHIRIQUI', a name of various application in Central America.—1. A province on the isthmus and in the state of Panama, Colombia.—2. A river flowing towards the n., the lat. and long. of its mouth being about 9° n., and 82° 30' east.—3. A spacious lagoon with three entrances, and with a depth of water for the largest ships, which receives the river.

CHIROMANCY, fortune-telling by a study of the human hand (always the left hand), once widely believed in and still practiced to some extent. The points to be observed are the lines, the projections, the joints, the nails, and the contour of the thumb and fingers. The principal line is the *line of life*, running in a curve from the upper joint of the forefinger around the ball of the thumb to the joint of the wrist. If this line shows four distinct and equal furrows near its beginning at the forefinger joint, the person is promised an easy attainment of wealth and honor. If the line be regular and deeply colored, a long and happy life is predicted; if it be freely marked, tortuous and broken, it foretells ill health and short life. If short perpendicular lines run from the line of life toward the palm of the hand, the person may be expected to go on a long journey; if toward the wrist, to be exiled. If the line of life be narrowed but long and strongly colored, it indicates ingenuity and wisdom; a deep line, equally colored, denotes a malicious disposition; and if separated near the center by sharply defined cross lines, it is a sign of approaching death. The next important line is the *line of health*, starting with the line of life and running nearly or wholly across the middle of the hand. If the line be clear and unbroken, it indicates excellence of body and mind; if it be broken and feeble, timidity and ill health are indicated. The *line of fortune*, or *happiness*, is below the line of health, and runs from the base of the fore to the base of the little finger. When this line is distinct and straight it indicates happiness and pleasant temper; if it begins close to the upper side of the hand, it indicates pride; if red in the upper section, envy is foreshadowed; a cross line, so that the two form an upright cross, indicates generosity; if broken and crossed by small lines near the middle, it indicates duplicity. Another line not found in all hands is the *line of the joint*, or *line of the triangle*, extending from the base of the little finger to the middle of the joint of the wrist. When this line is clear, it promises great success after much difficulty. The *mountain of Venus* is the elevation at the base of the thumb, and when smooth and unfurrowed a happy temperament is indicated. The *mountain of Jupiter* is the fleshy projection at the base of the forefinger; that of *Saturn* at the base of the middle finger; that of the *sun* at the base of the ring finger; that of *Mercury* at the base of the little finger, and that of the *moon* is the elevation or bunch on the lower side of the hand. When these mountains are clear and smooth, the indications are: of Jupiter, a heart inclined to virtue; of Saturn, love of labor, and simplicity of character; of the sun, eloquence and vivacious temperament; of Mercury, firmness in men, and modesty in women; and lastly, in the mountain of the moon, a tranquil disposition inclined to melancholy. The lines and shades on the mountains have their significance. Small lines near the little finger, parallel with the line of fortune, indicate happy wedded life, and some say their number foretells the number of children. One more line is called the *milky way*, running downward on the mountain of the moon from the wrist joint toward the little finger; if it be long and clearly defined, it foretells success in studies or in arts or fortune in a distant land. Small white spots under the nails indicate the fulfillment of wishes, at near or remote periods as they are far or near the roots. Aristotle regarded C. as a distinct science; the Roman soothsayers, and even the Emperor Augustus, practiced it; in the middle ages it was studied with alchemy and astrology by the greatest philosophers; the church tolerated it while condemning astrology, or its interference with the doctrine of human liberty.

CHI'RON, or **CHEIRON**, the most famous of the Centaurs (q.v.). In the ancient works of art, C. of course appears as half-man, half-animal; but his features, instead of expressing mere savage and sensual strength, as those of the Centaurs generally do, are marked by a mild wisdom, in harmony with the character and deep knowledge attributed to him by the Greek mythologists.

CHIRONEC'TES, a genus of salt-water fishes remarkable for their grotesque forms. The mouse-fish may be taken as a specimen.

CHIROSOPIY. See CHEIROMANCY.

CHIROPTERA. See BAT.

CHIR'BU, *Antelope Hodgsoni*, a species of antelope, inhabiting the pine forests and elevated open plains of Thibet, in regions bordering on the limits of perpetual snow. It is much larger than the chamois, being about 5 ft. in length, and the height at the shoulder about 3 ft. The C. lives in great herds, and seems to exceed almost all the other gregarious ruminants in watchfulness against the approach of danger. Sentinels are constantly posted to prevent surprise.

CHISA'GO, a co. in e. Minnesota, on the Wisconsin border; 435 sq. m.; pop. '90, 10,359. It is intersected by the St. Paul and Duluth railroad. The principal productions are wheat, corn, oats, hay, and butter. Co. seat, Center City.

CHISELHURST, a parish in Kent, England, 11 m. s.e. of London. It was here that Napoleon III. fixed his residence in 1871, and died Jan. 9, 1873. His widow, the empress Eugenie, dwells in Chiselhurst (1891).

CHISHOLM, CAROLINE (JONES), b. England, 1810; a noted philanthropist who settled in Australia in 1838 and founded at Sydney schools and asylums for destitute girls. In 1841-45 she procured employment for more than 11,000 persons, and lent in small sums about \$6,000, of which all but \$120 was returned. In her honor the people of Sydney founded the "Family Colonization Society." She d. 1877.

CHIS'WICK, a village in the center of Middlesex, $7\frac{1}{2}$ m. s.w. of St. Paul's, London, on the left bank of the Thames. Pop. '91, 21,964. Around C. are many fine villas, extensive market-gardens, to supply London, and the gardens of the London horticultural society. The churchyard contains the grave of Hogarth, and the Duke of Devonshire's beautiful villa, Chiswick House, is situated here. See Harper's Magazine, Aug., 1888.

CHITIN forms the skeleton of all insects and crustaceans. In insects, it constitutes not merely the external skeleton, the scales, etc., but also forms their tracheæ, and thus penetrates into the most remote portions of their organs; indeed, one of the layers of their intestinal canal consists of chitin. Hence, we can make good preparations of these parts by treating insects with a solution of potash, which dissolves all but the C.: in this way, we can microscopically examine the most delicate parts, as, for instance, the valves of the tracheal openings.

In a state of purity, it is a white amorphous body, which usually retains the form of the tissue from which it is prepared. It has been analyzed by C. Schmidt, Lehmann, and other chemists. Schmidt considers that its composition is represented by the formula $C_{12}H_{20}N_2O_{10}$. The best method of obtaining C. is by boiling the elytra of the cockchafer with water, alcohol, ether, acetic acid, and alkalies. The substance left after these respective boilings is pure chitin. It seems to be identical with the substance termed by Lassaigue *entomaderm*.

CHIT'ON, a Linnaean genus of mollusks. Linnæus, regarding merely the shell, placed them in the class of multivalves, a class entirely artificial. They are now regarded as constituting a family (*chitonidae*) of gasteropodous mollusks, of the order *cyclobranchiata* of Cuvier, and as occupying a place in systematic arrangement close to limpets. The shell is composed of eight narrow, transverse, calcareous pieces, overlapping each other in a row along the back, and strongly attached to the mantle, which is remarkably fleshy and fibrous. They have the power of rolling themselves up into a ball. The organ of locomotion is an oval foot, more or less wide, according to the species, and extending the whole length of the animal. More than 200 species are known; they occur in all climates, most abundantly on rocks at low water, but some of them at great depths. Some of them creep along the sand. All the British species are small; but some foreign ones grow to 3 or 4 in. in length. The fry of these mollusks swim about by means of long vibratile cilia.

CHITTAGONG, a maritime district in Lower Bengal, taking its name from its capital below mentioned. It is bounded on the s. by Arracan, and on the w. by the bay of Bengal, and stretches from lat. $20^{\circ} 45'$ to $23^{\circ} 25'$ n., and from long. $91^{\circ} 32'$ to 93° east. It has an area of 2,563 sq. m.; with a pop. (1891) of 1,290,000. C. (properly *Chattagram*) also gives name to a *division*; area, 12,118 sq. m.; pop. '91, 4,190,000. In the forests of C. large numbers of elephants are annually caught.

CHITTAGONG, or ISLAMABAD (the second name having been conferred by Aurungezebe, who captured it towards the close of the 17th c.), a city of India, standing on the Kurrumfuli, about 7 m. from its mouth, in lat. $22^{\circ} 20'$ n., and long. $91^{\circ} 54'$ east; It came into possession of the British, along with Bengal proper, in 1760-65. But having originally formed part of Arracan, it was claimed, after a lapse of sixty years, by the Burmese emperor as a dependency of that territory—a claim which formed one of the grounds of the war of 1824. Through the results of that contest, C. diminished in importance, but some European merchants began to settle there in 1864, and its prosperity is returning. It has a considerable export trade in rice, jute, gunny and tea. Population, '91, 24,100.

CHITTAGONG HILL TRACTS, a district on the e. frontier of British India, 5,419 sq. m.; pop. '91, 107,000, among whom were only a small number of Christians. The region is hilly, with deep ravines and prominent cliffs, covered with gigantic creeping plants. The crops are rice, corn, tobacco, and cotton.

CHITTAGONG WOOD, the wood of *chickrassia tabularis*, a tree of the natural order *cedrelaceæ*, a native of the mountainous countries to the e. of Bengal. In some parts of India it is called *cedar* or *bastard cedar*, names, however, which are also given to other kinds of wood. C. W. is much valued in India, and is used for all purposes for which mahogany is used in Britain. It makes beautiful and light furniture, but is apt to warp in very dry weather. Beautifully veined and mottled pieces are occasionally met with, and are highly valued.

CHITTELDRÖOG, or **CHITRADURG**, a t. in British India, in the province of Mysore, 280 m. w.n.w. of Madras. It is in a fertile plain, and was once one of the strongest places in India. The present fortress crowns a high rock in the rear of the town, and is a formidable defense. Hyder Ali besieged C. in 1776, getting possession eleven years later, but then only through treachery.

CHITTENDEN, a co. in n.w. Vermont, on lake Champlain; 516 sq. m.; pop. '90, 35,389. It is drained by the Winooski and Lamoille rivers, and traversed by the Central Vermont, and the Rutland railroads. The productions are wheat, corn, oats, potatoes, hay, cheese, butter, wool, and maple sugar. Co. seat, Burlington.

CHITTENDEN, MARTIN, 1766-1840; son of Thomas; a graduate of Dartmouth college, and for many years in judicial offices in Vermont. He was chosen to congress in 1803, and four times thereafter; and was governor of the state from 1813 to 1815.

CHITTENDEN, THOMAS, 1730-97; the first governor of the state of Vermont, b. in Conn., where he was a member of the legislature. In 1774, he settled in Vermont, and participated in all the political action of the people in councils and conventions, until the territory became a state, before and after which period he was the governor.

CHITTIM, KITTIM, the Phœnician name for the island of Cyprus. It was also known to the Jews under this name (Numbers xxiv. 24). Its chief town, Kitron, was an important slave-trading emporium for the Phœnicians.

CHITTOR, the name of two fortified towns in India.—1. C. in the district of Arcot, about 80 m. to the w. of Madras, in lat. 13° 12' n., and long. 79° 9' east. It stands on the s. or right bank of the Puni, an affluent of the Palar, and is about 1100 ft. above the sea. Its river varies, according to the season, from a small rivulet to an expanse of 400 yards in width. When the stream is at its lowest, the very tanks, as well as the deserted channel, become little better than slime—the result being fever, ague, dysentery, and other diseases. The thermometer has occasionally reached 140° in the sun; but the annual range in the shade runs from 56° to 100°.—2. C. in Odeypoor, or Mewar, about 270 m. to the s.w. of Agra, in lat. 24° 52' n., and long. 74° 41' east. The fortress occupies the summit of an isolated rock of nearly 6,000 yards in length, and of 1200 in breadth, which is scarped all round to a depth of 80 or 100 feet, about a fourth part of its entire altitude. Within the inclosure are several antique structures—such as temples, tanks, a palace, commemorative pillars, and an inner citadel.

CHITTY, JOSEPH, 1776-1841; a lawyer of England whose text-books have been considered almost necessary for students and young practitioners. The chief of his works are, *Treatise on the Parties to Actions and to Pleadings*; *Treatise on the Law of Nations relative to the Legal Effects of War on the Commerce of Belligerents and Neutrals*, and on *Orders in Council in Licenses*; *Political Treatise on Criminal Law*; and *Synopsis of Practice in the King's Bench and Common Pleas*.

CHIUSA LA, a town in the province of Palermo, Sicily, 30 miles s.w. of the city of Palermo. It lies on the slope of some hills and was built in 1320. Oil is produced, and fruits and sumach are cultivated. Pop. 7100.

CHIUSI, a t. of central Italy, province of Siena, 37 m. s.e. of Siena, with a pop. of 2,000, stands on an eminence in the Val di Chiana, not far from the lake of the same name. In ancient times, under the name of *Clusium*, it was one of the twelve republics of Etruria, and the residence of Porsena (q.v.). When Italy was overrun by the barbarians, C. fell into decay, the whole valley was depopulated, and became the pestilential pool described by Dante. Since the improvement of the course of the Chiana (q.v.), C. has begun to flourish again along with the whole district. But it is in connection with the discovery of Etruscan antiquities that C. is chiefly heard of. Within the last quarter of a century, immense quantities of these remains have been found in the neighborhood in the grottos that served the ancient Etruscans as tombs. There are three museums in C. filled with them, and a great number are in the public gallery at Florence. They consist chiefly of sun-dried earthenware vases, black, and partly covered with mythological figures. Excavations still continue to be made, but discoveries have become rarer of late years.

CHIVALRY (Fr. *chevalerie*, from *chevalier*, a knight or horseman), the system of knighthood, together with the privileges, duties, and manners of knights. The social arrangement to which this term is applied seems first to have assumed the character of a positive institution during the 11th c.; but so far from being an invention of that period, it had its roots in the manners of the Germanic races, amongst whom it ultimately arose, at the earliest period at which they are historically traceable. In the description which Tacitus has given us of the manners of the Germans, we find the most unequivocal indications of the existence, not only of the general spirit, but, in a partially developed form, of many of the special arrangements of chivalry. But it was in connection with feudality that C. attained to its full proportions, and in many respects it must be regarded as the complement of that institution. See FEUDAL SYSTEM. Whilst feudality exhibits the political, in C. we see the moral and social side of the arrangements of mediæval life. It was in the feudal mansions of the barons that the system was developed; and to the lay portion of the youth of the higher classes, the instruction which they there received in the usages of C. formed by far the most important part of education. In addition to the martial accomplishments, which corresponded to those of a modern cavalry-officer, they were instructed in the political relations which subsisted between the vassal and his lord, by which the whole body of society was then bound together; and in what might almost be called a system of ethics, strangely enough exhibiting unmistakable traces of the stoic philosophy. The analogy between the severer virtues recommended to the special cultivation of their disciples by the followers of Zeno, and those inculcated on the novice in C., and practiced by the knights of the middle ages, might be ascribed to other than historical causes, were it not that we are able to trace the connection between them with something approaching to certainty. If any one wishes to convince himself of the truth of our assertion, let him compare the last production of the intellectual life of antiquity with one of the earliest and most important of our own literature, the *Consolations of Philosophy* of Boethius with Chaucer's *Testament of Love*. The resemblance is so close, that the latter work has, not without reason, been regarded as an imitation of the former; but the main features which distinguish them, and mark Chaucer's work as belonging to the modern world, are more instructive than even their similarity. The place which Philosophy, the celestial consolator, occupies in the work of Boethius, in that of Chaucer is supplied by *Love*—a being whom we must in nowise confound either with the heathen goddess, or, as some have done, with the divine love of the Christian religion. She is neither more nor less than the embodiment of an abstract idea which formed the central point of the whole system of C.; and her substitution for the philosophy or reason of Boethius is very characteristic of a state of society in which the affections and passions, rather than the intelligence, were the motive principles. The "Love" of Chaucer is a complete generalization, altogether independent of individual object, and the consolation which she proffers to her votary is that of enlisting in his favor the special guardian, the "Margarite," who is supposed to watch over his individual fortunes. The "Margarite" seems to correspond to the chivalrous idea of the *Lady-love*, in its purest sense, when its reference to a person was by no means indispensable, but when it signified rather "the love of woman," the highest object of the knight's ambition. Under the protection of this guardian spirit, the lover is represented as altogether sheltered from the caprices of fortune, and in her name he has a dose of rather frigid comfort administered to him, greatly resembling that which Boethius receives at the hands of Philosophy. Such is the general idea of the book, and it is a noble idea, embracing the very essence of society as it existed then, and presenting a much deeper view of that singular institution C. than is usually to be met with in writers who have not been actually brought in contact with its influences. But to the two elements which we have mentioned as ingredients in the spiritual life of C., the Germanic traditions on the one hand, and those of classical antiquity on the other, a third falls to be mentioned, which was, perhaps, the most important of all—that of Christianity as represented by the church. The clergy were too fully aware of the importance of early impressions, not to seize on the imagination of the aspirant to C. at the all-important moment of his inauguration. The purifications, prayers, and vigils, the sacrament and the vows by which this solemn rite was accompanied, are detailed elsewhere (see KNIGHT, BANNERET, BATH, etc.); and their influence in casting a religious character over the whole institution of C., and occasionally in directing its energies specially to the propagation of Christianity, by means of the various religious orders of knighthood and the crusades, is well known. Nor was the poet behind the priest in availing himself of the influences of C., and developing them in the region of the imagination. What Chaucer has exhibited in the work to which we have referred, may be regarded rather as the philosophical than the poetical side of the institution. But to poets of a lighter and more imaginative cast of mind, C. has furnished, from the days of the troubadours down to the present poet-laureate, no insignificant portion of their subject-matter. King Arthur and his knights of the round table, the traditions regarding whom had been taken from a period altogether mythical, and long anterior to the existence of C. as an institution, became to the poetry of the middle ages very much what the heroes of the Trojan war were to that of the whole ancient world. Much astonishment has often been expressed at the contrast between the lofty and ideal purity of the code of morals inculcated by C., and the gross

ness of the lives of the men who were trained under its influences. The case is one which in a remarkable degree proves the practical importance of the inculcation of sound doctrine, for the practice gradually, though slowly, conformed itself to the principles; and it is probably in no insignificant degree to the elevated tone of the latter that we owe the moral superiority of the modern over the ancient world.

CHIVALRY, COURT OF, a military court, established by Edward III., of which the earl marshal and the lord high constable were joint judges. When held before the earl marshal alone, it was merely a court of honor; but when both were present, it was also a criminal court. Having encroached on the common law, its jurisdiction was defined by 13 Rich. II. stat. i. Under this act, the court claimed power to give relief to such of the nobility and gentry as think themselves aggrieved in matters of honor, and to keep up the distinctions of degrees and quality. In criminal cases, a jury was sworn; but in general the proceedings of the court were summary matters, being brought under its cognizance by complaint or petition. An attempt was made to revive the functions of the court in Queen Anne's time; but, except as represented by the earl marshal's court (see **HERALDS' COLLEGE**), it has now gone into abeyance.

CHIVASSO, a small city of Piedmont, northern Italy, situated in a fertile plain on the left bank of the Po, about 15 m. n.e. of Turin. It was formerly a place of considerable military importance, but its fortifications were destroyed in 1804 by the French. The lampreys of C. are celebrated throughout Piedmont. It has manufactures of bricks, earthenware, soap, etc., and a trade in the agricultural produce of the district. Pop. about 9000.

CHIVE, or **CIVE**, *Allium schoeno-prasum*, a plant of the same genus with the leek and onion (see **ALLIUM**), a perennial, $\frac{1}{2}$ to 1 foot in height, with very small, flat, clustered bulbs, increasing by its bulbs so as to form a sort of turf. The leaves are tubular, cylindrical-tapering, radical, nearly as long as the almost leafless flowering-stem, which is terminated by a hemispherical, many flowered, not bulbiferous umbel of bluish red, or, more rarely, flesh-colored flowers. The stamens are included within the perianth. This rather pretty little plant grows wild on the banks of rivers, and in marshy or occasionally flooded places in the middle latitudes of Europe and Asia. It is a rare native of Britain. In some of the mountainous districts of Europe a variety is found, larger and stronger in all its parts, and with flowering-stems more leafy. Chives—the name is generally used in the plural—are commonly cultivated in kitchen-gardens, often as an edging for plots, and are used for flavoring soups and dishes. Their properties are very similar to those of the onion. The part used is the young leaves, which bear repeated cuttings in the season.

CHIZEROTS AND BURINS form one of those peculiar races in France that live isolated in the midst of the rest of the population, and are despised and hated by their neighbors. They live in the arrondissement of Bourg-en-Bresse, in the department of Ain; and the communes of Sermoyer, Arbigny, Boz, and Ozan belong to them. According to tradition, they are descended from the Saracens. Although industrious and prosperous, they are held in the utmost contempt and detestation by their peasant neighbors, who are often indolent and destitute. They are looked upon as covetous and malicious, and scarcely would the daughter of a small farmer, or well-to-do day-laborer, become the wife of one of them, so that they mostly marry among themselves. From time immemorial, the C. and B. have been field-laborers, cattle-dealers, butchers, etc. Many of them are very good-looking. The young women are handsome, clear-complexioned, with large black eyes. See Michel, *Histoire des Races Maudites de la France et de l'Espagne* (2 vols., Par. 1847).

CHLADNI, ERNST FLORENS FRIEDRICH, founder of the science of acoustics, was b. at Wittenberg, Nov. 30, 1756. He studied law in his native place, and also in Leipsic, where, in 1782, he was made doctor of laws. C. ultimately abandoned judicial studies altogether, devoted his mind to natural science, and, being acquainted with music, was led to observe that the laws of sound were by no means so well established as those of other branches of physics. He therefore began to apply his knowledge of mathematics and physics to acoustics, and traveled for 10 years (after 1802) through Germany, Holland, France, Italy, Russia, and Denmark, giving lectures on the subject, which were very successful. He died in Breslau, April 3, 1827.—C.'s writings include *Discoveries concerning the Theory of Sound* (1787); *Acoustics* (1802); *New Contributions to Acoustics* (1817); and *Contributions to Practical Acoustics, with Remarks on the making of Instruments* (1822). C. also wrote several essays on meteoric stones.

CHLAMYDOSAU'RUS, a lizard of Australia, which has on its neck a singular mantle or plaited frill covered with scales and edged with spines. When full grown, this lizard is nearly 3 ft. long.

CHLAMYPH'ORUS (Gr. *chlamys*—bearing; *chlamys*, a soldier's cloak), a very remarkable genus of mammalia of the order *edentata*, ranked by naturalists in the same family with the armadillos, but differing in important respects from them, and from all other known quadrupeds. Only one species is known, *C. truncatus*, 5 or 6 in. long, a native of the interior of Chili, living underground like the mole, which it much resembles in its habits, and feeding on the same kind of food. Its forefeet are adapted for digging,

although in a different manner from those of the mole. The skull is destitute of sutures; there are resemblances to the osteology of birds in the ribs and their union to the sternum; the hinder part of the body is altogether unlike that of any other known animal, in its terminating quite abruptly, as if cut off almost where its thickness is greatest, or as if the back were suddenly bent down at right angles, the tail not springing from where the line of the back appears to terminate, but far below. The whole upper and hinder parts of the body are covered with a coat of mail, made up of a series of square plates; the under parts and legs are covered with long silky hair.

CHLAMYS, an outer garment worn by the Greeks and some other people of the east. It was of wool, smaller than the more common blanket, of finer material, and often of brilliant colors. It was an oblong square, twice as long as its width. The wearer fastened the corners of the shortest side to the middle of the chest, the chlamys falling down over the back to the knees; or when fastened on the right shoulder it fell over the left arm and side. The chlamys for women often had a fringe or border of rich colors.

CHLOPICKI, JOSEPH, a Polish general, and dictator of Poland during the revolution of 1830, was b. in Galicia in 1771. He entered the army in 1787, attracted the notice of Kosciusko during the first insurrection of the Poles, and after the storming of Praga, 9th Nov., 1794, when the hopes of the patriots were extinguished for a while, he passed into the service of the new Cisalpine republic, and distinguished himself in various battles. In 1806, when Bonaparte called the Poles to arms, C., among others, obeyed, and fought gallantly at Eylau and Friedland. He was subsequently sent by the emperor into Spain, and in 1812 followed him to Russia, taking part in the bloody engagements at Smolensk and Moskwa. After the relics of the invading force had returned, C. left the imperial service, on account of receiving certain slights in the way of his professional advancement. After the taking of Paris by the allies in 1814, he led back to Poland the remains of the Polish troops who had fought under Bonaparte, and was well received by the Emperor Alexander, who made him a general of division. When the second insurrection of the Poles broke out in 1830, C., who foresaw the hopeless nature of the attempt, concealed himself; but the voice of the nation called him forth from his hiding-place, and on the 5th Dec., 1830, he was elected dictator. His moderate views, however, involved him in disputes with the extreme patriotic party, and on the 23d Jan., 1831, he resigned his office; but, to prove his sincerity, he entered the Polish army as a simple soldier, and took part in the murderous battles at Wavre and Grochow. After the suppression of the insurrection, C. went to Cracow, and withdrew altogether from public life. He died at Krzeschowitz, 30th Sept., 1854.

CHLORAL, $\text{CCl}_3 \cdot \text{COH}$, an oily, colorless liquid, with a penetrating and peculiar odor prepared from anhydrous alcohol by the action of dry chlorine gas. Liebig discovered it in 1831, and Liebreich, in 1869, was the first to use the C. hydrate as an anæsthetic and hypnotic. It is closely allied to aldehyde, and dissolves phosphorus, sulphur, bromine, and iodine. It is composed of carbon, hydrogen, oxygen, and chlorine, formula C_2HOCl_3 . Combined with water, it forms chloral hydrate, a transparent crystalline substance, having the appearance of alum, sometimes administered to induce sleep. Its effect is attributed to chloroform produced in the system from the chloral by the alkaline reaction of the blood. As a rule 20 grains cause in a healthy adult a light and refreshing sleep, after about half or three quarters of an hour, without headache or other bad results. Repeated use blunts the good effect, and causes serious nervous demoralization; overdoses have caused death. Chloral hydrate has special value where the use of opium is inadmissible; also in delirium tremens, mania, rheumatism, gastralgia, and as antagonistic to tetanus and the effects of strychnia. Yet it is seductive and dangerous.

CHLORALAMID, a preparation of chloral discovered by Prof. J. Von Mering, a German chemist, in 1889. It is prepared in the form of colorless non-caustic crystals, is soluble in from nine to fourteen parts of cold, or less of warm water, in one part of absolute, and one and a half parts of ninety-six per cent. alcohol. To understand its time of action, it is well to remember that it requires five hours to dissolve twenty grains in two ounces of water, and only fifteen minutes when the medium is one drachm of rectified spirit. No precipitation occurs on adding the alcoholic solution to water. It is essentially a hypnotic, and in hysteria, melancholia, insomnia, and hypochondriasis it is found to be particularly serviceable. It has also been administered with success in cases of painful menstruation. The dose is from 15 to 30 grains, with an average dose of 20 grains. The advantage in using chloralamid is that the influence of the drug will be sufficient to produce refreshing sleep for a period ranging from four to six or more hours, and that it does not show any special tendency to impair digestion. It is best administered in the form of a solution in a little whiskey, wine, or brandy, to which may be added a small amount of syrup. See **HYPNOTICS**.

CHLORASTROLITE (Geological). This delicate green-hued mineral is radiate or stellate in structure and takes a high polish. It is an impure variety of prehnite, very compact, forming nodules in the amygdaloid of Isle Royale, Lake Superior.

CHLORIC ACID, HClO_3 , is the most important of the oxygen acids of chlorine, and is generally met with in combination with potash, as the white crystalline salt, chlorate of potash, KClO_3 . This salt is mainly interesting from the readiness with which it parts with its oxygen to combustibles, as when thrown on red-hot charcoal, when it causes violent deflagration. The salt is employed in the fabrication of certain kinds of lucifer-matches, which give a slight explosion when struck. If a crystal of chlorate of potash, be placed on a piece of paper saturated with turpentine, and a drop or two of oil of vitriol added, it causes the inflaming of the turpentine with explosive rapidity. The chlorate of potash is also used in medicine, with the view of imparting oxygen to the blood; its use, however, is attended with danger.

CHLORIC ETHER, a name formerly given to a compound of chlorine and olefiant gas, also called chloride of ethylene, or *Dutch liquid*. Now applied to a mixture containing one part of chloroform and eight or nine parts of strong alcohol. Dr. John C. Warren's "chloric ether," used by him as an anæsthetic, contained one part of chloroform and two of alcohol. C. E. is used as a means of administering chloroform internally; it is a mild anodyne, useful to allay restlessness and spasmodic disturbances, as of the air-passages.

CHLORIMETRY, or **CHLOROMETRY**, is the process of estimating the proportion of available chlorine in bleaching powder (q. v.), which may vary from 20 to 36 per cent. The process depends upon the great power with which chlorine, in the act of being liberated from its compounds, causes the oxidation of many substances. The salt generally used is pure crystallized sulphate of iron, which, in its ordinary state, gives a deep blue color, with a drop of ferridcyanide of potassium, but ceases to do so when it has been fully oxidized, or converted from a proto-salt into a per-salt, through the influence of chlorine. It being known that 78.4 grains or parts of sulphate of iron are oxidized by 10 grains or parts of chlorine, the mode of procedure in C. is as follows: 78.4 grains of fine crystals of the sulphate of iron are dissolved in water slightly acidulated with hydrochloric acid in a white porcelain basin. A given quantity of the bleaching powder—say 50 grains—is dissolved in a little tepid water, and introduced into a tall measure-glass called a chlorimeter or burette, similar to an alkalimeter, which is divided into 100 parts, and water added till the solution rises to the top mark. After subsidence of the insoluble matter, the clear solution is very gradually poured into the solution of sulphate of iron in the basin, the whole being kept constantly stirred, and every now and again a drop of the iron solution is taken out and placed on a new drop of ferridcyanide of potassium placed on a white plate; and whenever the iron solution ceases to produce a deep blue, and only forms a light greenish-yellow tint, it is known that the iron has been fully oxidized by the chlorine. Suppose that at this stage the burette has been emptied to the 55th division; as we know that the liquid poured out must have contained 10 grains of chlorine, we can calculate the chlorine contained in the whole; for

$$55 : 10 :: 100 : 18.18.$$

Thus 50 grains of the powder contain 18.18 grains of chlorine, or 36.36 per cent. Protochloride of manganese, subchloride of mercury (calomel), or a solution of indigo of known strength, may be employed instead of the sulphate of iron; but the latter is preferable, and is generally employed by chemists and manufacturers.

CHLORINE (Gr. *chlōros*, pale green) is a non-metallic element discovered by Scheele in 1774, and named by him *dephlogisticated marine air*. Afterwards, in 1810, Davy proved it to be an elementary body, and gave it the name which it now bears. In nature it is always found in a state of combination. United with sodium, Na, it occurs very largely as the chloride of sodium, NaCl —common salt—in the ocean; in large beds, as rock-salt; in all natural waters, including even rain-water; in clays, soils, limestone; in volcanic incrustations; and in the vegetable and animal kingdoms. The preparation of gaseous C. by its liberation, directly or indirectly, from common salt, has been fully described under BLEACHING POWDER, which is the form in which C. is prepared and employed commercially. For experimental purposes, the gas may be received in jars filled with water at the pneumatic trough, when the C. rises into the jar, and displaces the water. When thus obtained, it is a yellowish-green gas with a peculiar and suffocating odor, is not combustible, and a very feeble supporter of ordinary combustion. A lighted candle placed in it burns with a very smoky flame, owing to the hydrogen of the oil alone burning, and the carbon being liberated. Several of the metals, such as antimony, copper, and arsenic in a fine state of division, or in the condition of thin leaves, at once become red hot, and burn when introduced into the gas. A piece of thin paper soaked in turpentine likewise bursts into flame. C. has the symbol Cl, and the atomic weight or equivalent of 35.3. It is a very heavy gas, nearly $2\frac{1}{2}$ times heavier than air, its specific gravity being 2,470 (air=1000); it is soluble in cold water to the extent of two volumes of C. in one of water, and yields a solution resembling the gas in color, odor, and other properties. The principal properties of C. are those of a bleacher of cotton and linen (see BLEACHING), and a most powerful disinfectant (q.v.). The gas can be condensed by pressure and cold into a transparent dark greenish-yellow limpid liquid, with a specific gravity of 1330 (H_2O =1000), which also

possesses bleaching properties, and a most powerful odor. On the animal system *C.* acts, in very minute quantity, by producing a sensation of warmth in the respiratory passages, and increasing the expectoration; in large quantity, by causing spasm of the glottis, violent cough, and a feeling of suffocation. The workmen in chemical manufactories, who get accustomed to the *C.* in small quantity, are generally stout—at least, lay on fat—but complain of acidity in the stomach, which they correct by taking chalk, and also suffer from the corrosion of their teeth, which are eaten away to stumps. The antidotes to the evil effects of the introduction of *C.* into the lungs are the inhalation of the vapor of water, alcohol, ether, or chloroform; but the two latter should never be resorted to except under medical supervision.

C. unites with the metals and many other substances to form an extensive class of salts known as *chlorides*.

CHLORITE (Gr. *chlōros*, green), an abundant mineral, consisting of silica, alumina, magnesia, and protoxide of iron, in somewhat variable proportions. It is of a green color, rarely occurs crystallized in hexagonal crystals, sometimes foliated like talc. It is rather soft, and is easily broken or scratched with a knife. Before the blow-pipe, it is with difficulty fused on thin edges. It is readily distinguished from talc by yielding water in a closed tube.

CHLORITE-SCHIST, or **CHLORITE-SLATE**, a green slaty rock, in which chlorite is abundant in foliated plates, usually blended with minute grains of quartz, and sometimes with feldspar or mica.

CHLORODYNE is a patent or quack medicine of considerable popularity, invented by a Dr. Collis Browne, but largely imitated by various chemists. It contains opium, chloroform, prussic acid, and probably Indian hemp, and is flavored with sugar and peppermint. As it is apt to separate into two liquids on standing, it should never be taken unless it has previously been well shaken; and as, in taking a dose of chlorodyne, the patient swallows an unknown quantity of three or four of the deadliest poisons with which we are acquainted, it is always advisable to begin with small doses. It is unquestionably a compound which sometimes succeeds in allaying pain and inducing sleep, when opiates have failed; but whether a physician is justified in recommending a remedy with the composition of which he is unacquainted, is a doubtful question. Ten or fifteen drops is the average dose.

CHLOROFORM, or **TRICHLORMETHANE**, CHCl_3 , was originally discovered by Liebig in 1831, and experimented upon by Dumas, and was long known only to scientific chemists as a rare organic body, possessing interest from being one of a series of organic substances, but not known to possess any properties likely to call it into use, or even likely to let it be known by name to the general public. The remarkable power, however, which it possesses of producing anæsthesia, has led to the preparation of *C.* on a very extensive scale. The materials employed are alcohol, water, and bleaching powder, and the proportions are four parts of bleaching powder, to which sufficient water is added to make a thin paste, and thereafter one part of spirits of wine; the whole is introduced into a capacious retort, which must not be more than half filled, and heat being applied, the *C.*, accompanied by water and a little alcohol, distills over. As the *C.* is heavier than water, and is not readily miscible therewith, two layers of liquid are obtained in the receiver—the upper being water and alcohol, and the lower being chloroform. The upper liquid being cautiously poured off, the *C.* is agitated with fused carbonate of potash, which abstracts the remaining traces of water, and on subsequent redistillation the *C.* is obtained pure and ready for use.

C. is a highly limpid, mobile, colorless liquid, which is very volatile, has a characteristic and pleasant odor, and an agreeable sweetish taste. It has a specific gravity of nearly 1500 (water=1000), being half as heavy again as water, and boils at 142°F. (61°C.). It is not inflammable in the ordinary sense of the term, as it will not take fire when a light is brought down upon it; but when thrown on red-hot coals, it burns with a green flame, evolving much smoke. It is slightly soluble in water, but more readily mixes with alcohol and ether. It dissolves camphor, amber, copal, and other resins, wax, caoutchouc, black and red sealing wax, iodine and bromine, as well as strychnine and other alkaloids. Its purity may be determined by placing some on the palm of the hand, and allowing it to evaporate, when no alcoholic or other odorous substance should be even momentarily recognized; and by agitation with oil of vitriol, when, on settling, the *C.* should readily swim on the surface of the vitriol, and the two layers of liquid remain colorless. The employment of *C.* as an anæsthetic has already been considered under **ANÆSTHESIA**; but it may be here repeated that *C.* is a substance that cannot be too cautiously dealt with, and that it should never be administered except in the presence and by the sanction of a medical practitioner. When skillfully given, it is among the safest of all anæsthetics, and the greatest boon that chemistry has bestowed on suffering humanity.

CHLORO METHYL, or **METHYLENE BICHLORIDE**, CH_2Cl_2 ; a liquid—clear, volatile, of pleasant odor; when inhaled, producing anæsthesia more quickly than chloroform, and usually free from disagreeable consequences. Like chloroform, not absolutely safe.

CHLOROPHYLL (Gr. *chlōros*, green, and *phyllon*, a leaf), the substance to which the leaves and other parts of plants owe their green color. It is somewhat analogous to wax, is soluble in alcohol and ether, but insoluble in water, and floats in the fluid of the cells, in the form of minute granules. Light is indispensable to its formation, and hence arises the familiar phenomenon of blanching (q. v.), either from accidental causes, or by the art of the gardener. Young leaves do not exhibit so deep a green as those which have been longer exposed to the light; and the green of a leaf generally deepens till it begins to change into the tints of autumn. *Hydra viridis*, and other minute animals, appear to owe their green color to a substance analogous to chlorophyll.

CHLOROPS. See CORN-FLY and WHEAT-FLY.

CHLOROSIS (Gr. *chlōros*, pale green), a peculiar form of anæmia or bloodlessness, common in young women, and connected with the disorders incident to the critical period of life. It has been called the *green sickness*, from the peculiar dingy greenish-yellow hue of the complexion; the green color, however, is not always characteristic. The disease is attended with very great debility, and often with breathlessness, palpitation, and other distressing or even alarming symptoms. When there is no organic disease present, however, C. may be pronounced curable in a large proportion of cases. The principal means to be employed are air, exercise, often salt-water baths, the use of iron, with a nutritious and rather stimulating diet, and purgatives if required; together with such special remedies as are adapted for restoring deficient secretions, and bringing the entire female system of organs into a natural condition.

CHLOROSIS, a diseased state of plants, in which a sickly green or greenish-yellow color takes the place of the natural lively hue. Sometimes only a particular shoot is affected by it, but very generally the whole plant; and it seems to depend upon causes which render the plant altogether unhealthy, the pallid appearance being merely symptomatic, and not only the formation of chlorophyll, but all the functions of vegetable life being languidly and imperfectly carried on. Bad seed, damp soil, and cold wet weather, appear to be the most common causes of chlorosis. Plants affected by this disease are often to be seen among crops generally healthy; but whole crops of grain, potatoes, etc., sometimes perish from it, or are much diminished in value. Fruit-trees also suffer from it.

CHLOROXYLON, plants of the order cedrelacæ, the fruit having only three cells and splitting into three parts. The satin-wood of India is a specimen.

CHOATE, JOSEPH HODGES, lawyer, b. Salem, Mass., Jan. 24, 1832; graduated at Harvard, 1852, and at the Dane law school, 1854; admitted to the bar, 1855; and afterwards practiced in New York. He was counsel for Gen. Fitz John Porter; a member of the Committee of Seventy; president of the New York state constitutional convention of 1894; and unsuccessful candidate for U. S. senator in 1897.

CHOATE, RUFUS, LL.D., 1799-1859; a native of Massachusetts. In 1824 he commenced the practice of law in Danvers, soon removed to Salem, and in 1825 and 1827 was a representative and a senator in the state legislature. In 1832 he was elected to congress, and on the expiration of his term, removed to Boston. In 1841 he was chosen U. S. senator to fill Daniel Webster's unexpired term, the latter having been appointed secretary of state. In 1846 he resumed law practice in Boston, and in 1853 was chosen attorney-general of the state. His mind was acute, his scholarship broad and fine, his rhetoric magnificent. For many years he was recognized as the foremost lawyer of New England, and was especially renowned for eloquence in pleading. His more famous efforts were a eulogy on President Harrison, an address on the landing of the Pilgrims, and a eulogy on Daniel Webster. His works and correspondence have been published.

CHOCARD, or **CHOQUARD**, *Pyrrhocorax*, a genus of birds of the crow family (*corvidæ*), differing from the choughs in having a shorter bill, which, however, is arched like theirs, but resembling them in their habits. The only European species is the Alpine C., also called Alpine chough, and Alpine crow (*P. pyrrhocorax*). It is about the size of a jackdaw, of a brilliant black, with yellowish bill and red feet.

CHO'CO, a bay and province of New Granada, in South America.—1. The bay, forming part of the gulf of Darien, receives the Atrato (q. v.), a stream of note in connection with interoceanic communication. Its lat. and long. are about 3° 30' n., and 77° 30' west.—2. The province forms the w. portion of the department of Cauca (q. v.).

CHOCOLATE is made from the seeds of *Theobroma cacao* (see COCOA), reduced to a fine paste in a heated iron mortar, or by a machine, and mixed with pounded sugar and spices, as cinnamon, cloves, cardamom, vanilla, etc. The paste is then poured into molds of white iron, in which it is allowed to cool and harden. C. is sometimes made without spices, but is then more generally called cocoa. The paste is sometimes mixed with flour, and with Carrageen or with Iceland moss; and for medicinal purposes with cinchona, etc. C. is used as a beverage, and for this purpose is dissolved in hot water or milk. Sometimes the yolk of an egg is added, and sometimes it is dissolved in soup or wine. It is also employed in making certain liqueurs. In a pure state, it soon satisfies the appetite, and is very nourishing; when it contains spices, it is also stimulating. Good C. is externally smooth, firm, and shining—not gritty in the fracture—easily soluble, aromatic; not viscid after having been liquefied and cooled, but oily

on the surface, and leaves no sediment of foreign substances. C. is adulterated in many ways, by mixing it with rice-meal, oat-meal, flour, potato-starch, roasted hazelnuts or almonds, and with benzoin, storax, etc., in place of vanilla. The Mexicans, from time immemorial, were accustomed to prepare a beverage from roasted and pounded cocoa, dissolved in water, and mixed with maize-meal and spices. This they called *chocolatl* (*choco*, cocoa, and *latl*, water). From the Americans, the Spaniards derived an acquaintance with C., and by them it was introduced into Europe in 1520. C. is used in South America, Spain, and Italy, more than in other parts of the world, although it is used to a considerable extent in Germany. Its use in Britain has given place in a great measure to that of the simpler cocoa.

CHOCOLATE ROOT. See **GEUM**.

CHOCTAW, a co. in s.w. Alabama, on the Mississippi border; 916 sq.m.; pop. '90, 17,526, includes colored. It is watered by tributaries of the Tombigbee. Production chiefly agricultural. Co. seat, Butler.

CHOCTAW, a co. in central Mississippi, on Big Black river; 404 sq.m.; pop. '90, 10,847, includ. colored. Agriculture is the chief business. Co. seat, Chester.

CHOCTAWS, or **CHAHTAS**, a tribe of American Indians now occupying a portion of the Indian territory on Red river, numbering about 16,000, and possessing 10,450 sq.m. of land. When first known to Europeans they occupied the country now forming the w. part of Alabama and s. part of Mississippi. When Louisiana was settled they formed an alliance with the French against the Chickasaws and the Natchez. By degrees they became friendly to the English, and in 1786 they recognized the supremacy of the federal government. About 1800, they began to emigrate beyond the Mississippi. In the war with England and the Creek war they did great service to the union. Georgia gave them special privileges, even making them citizens, but they preferred to emigrate, and were all gone soon after 1830. In 1818, missions were established among them. In the civil war, they went with the confederates, but after it was over new treaties were made by the United States, slavery was abolished, and other necessary changes made. They have a regular constitution, prefaced by a bill of rights. Free males 21 years old and six months citizens of the nation are voters. There is a house of representatives of 17 to 35 members chosen for two years. The governor is elected for two years by the people, and is eligible for four years only out of any term of six. There are courts, supreme, civil, and probate; and justices of the peace. Books are printed in their language, and a newspaper is regularly issued every week at their chief town.

CHODOWIECKI, DANIEL NICOLAS, 1726-1801; a Polish painter and engraver who designed and engraved subjects from the seven years' war, and subsequently the "History of the Life of Jesus Christ," a series of miniature paintings that made him at once famous. Thereafter he was represented by his work in almost every book of importance published in Prussia in which engravings could be used. Still, the picture of "Calas and his family" is the only one of C.'s that has wide reputation.

CHONIX, a Grecian measure of capacity variously represented as equal to 0.186, 0.248, and 0.495 of an English gallon. It is supposed to have been used chiefly for measuring grain.

CHORILUS, a Greek tragic writer of the time of Thespis and Æschylus. He was a competitor for the tragic prize in 529 B.C. It is said that he took 13 prizes, and was the author of 150 tragedies, besides other works that have been lost.

CHORILUS OF SAMOS, a Greek writer, b. about 470 B.C.; author of a poem treating of the wars of Greece with Darius and Xerxes. Fragments of his writings have been preserved in the works of Aristotle, Josephus, and Ephorus.

CHOIR (Lat. *chorus*). In its literal sense, the C. is the portion of the church devoted to the singers; and in all descriptions which concern the ritual it is so limited, including only the space from the western door or screen to the end of the stalls, whilst the part from the stalls eastward to the high altar is called the presbytery. But in ordinary language, and even as used by architects, it denotes the entire space which is inclosed for the performance of the principal part of the service. In this sense, it includes the C. proper and the presbytery, and corresponds to the chancel in parish churches. Where the church is cruciform, and the term is confined to the eastern limb, it comes to be entirely different from the C. in the ritual sense, or the stall-place, which in such a building is commonly situated either under the tower or in the nave. In large churches, the aisle generally runs along each side of the C., and frequently passes across the e. end of it; an arrangement which is very common in the larger churches of the continent which have polygonal or semicircular terminations.—C. is also the name given to the singers of the choral service.

CHOIR-SCREEN, or **CHOIR-WALL**, the screen or wall which divides the choir and presbytery from the side aisles. It is often very richly ornamented.

CHOISEUL, CLAUDE ANTOINE GABRIEL, Duc de, 1760-1838; a col. of dragoons during the French revolution, and a warm supporter of the royal cause. He made an attempt to rescue Louis XVI. from the revolutionists, but the royal party was recaptured, a price was set upon C.'s head, and he was compelled to fly. He raised a regiment of

hussars and joined the royalist army. He was finally taken prisoner and confined at Dunkirk. He escaped, and sailed for India, but was wrecked on the coast of France, captured, and condemned to death. Yet he escaped death, and at the restoration he was called to the house of peers by Louis XVIII. In the revolution of 1830, he was a prominent member of the provisional government, and afterwards received from Louis Philippe the post of aide-de-camp to the king and governor of the Louvre.

CHOISEUL-AMBOISE, ETIENNE FRANÇOIS, Duc de, minister of Louis XV., was b. June 18, 1719, educated by the Jesuits, and on the completion of his studies, entered the army. He fought bravely in the Austrian wars of succession; but only after he had attracted the fancy of the king's mistress, Madame Pompadour, did fortune also really favor him. Through the influence of Madame Pompadour, he was made lieutenant-general in 1748, ambassador to the courts of Rome and Vienna in 1756, and duc de Choiseul in 1758. C. now became instrumental in bringing about a family league of the Bourbon monarchs in Europe; and in 1763, at the close of the war so disastrous to the French arms, he obtained, by his prudence and dexterity, milder terms for his nation than had been expected. This made him very popular, as did also his successful attempt to overthrow the Jesuits. In 1764, Madame Pompadour died, but the power of C. continued unabated. He conceived, and almost carried out, a plan for the formal emancipation of the Gallican church from papal influence, paid great attention to the improvement of the army and navy, developed the trade and industry both of the nation and of the colonies, and opened up anew an intercourse with India, whose native princes were assisted by French officers in their endeavors to expel the British from the peninsula. He had spies in every European court, and so ruled all diplomatic and political cabals, that the empress of Russia, who dreaded him, called him *Le Cocher de l'Europe* ("the driver of Europe"). But the rise of Madame Dubarry, who succeeded Madame Pompadour in the royal affections, gradually alienated Louis from his able minister, and in 1770 he retired to his magnificent estate of Chanteloup, where he lived in princely splendor. After the accession of Louis XVI., C. received permission to return to Paris. He was often consulted, but never recovered his official position. He died May 7, 1785.

CHOISEUL-GOUFFIER, MARIE GABRIEL FLORENT AUGUSTE, Comte de, 1752-1817; a French scholar who traveled in the east, and published in 1782 the first volume of his *Voyage Pittoresque en Grèce*. During the revolution he adhered to the royal cause, and afterwards went to Russia, where he was made director of the imperial libraries, and of the academy of fine arts. Another part of his work appeared in 1809, and the concluding portion in 1824, after his death.

CHOKE-CHERRY, a name given to certain nearly allied species of cherry (q.v.), of the bird-cherry section of the genus or sub-genus, natives of North America, having small fruit in racemes, and the fruit at first rather agreeable, but afterwards astringent in the mouth. Some confusion has long existed as to the different kinds, and their botanical names (*prunus* or *cerasus virginiana*, *serotina*, and *borealis*) are not more determinate than the popular ones. Perhaps they ought to be regarded as mere varieties rather than distinct species. They have a considerable resemblance to the Portugal laurel, although the leaves are deciduous. The bark is used as a febrifuge and tonic, under the name of *wild cherry bark*; and by distilling it with water, a volatile oil is obtained from it associated with hydrocyanic acid, called *oil of wild cherry*. This bark allays nervous irritation, and is particularly suitable as a first tonic in cases of recovery from fever or inflammation.

CHOKEDAMP. See CARBONIC ACID.

CHOKING, the obstruction of the gullet, or of the passage leading to it, by morsels of food imperfectly chewed, or other substances accidentally swallowed. The consequences of C. in the human subject are serious, and will be best considered in connection with the parts concerned. See PHARYNX and ŒSOPHAGUS. What follows relates to the C. of cattle.

Causes.—These may be classified under two heads: 1. Those that depend on the material swallowed; and 2. Those that depend on the animal swallowing. Under the first head we find sharp-pointed objects which become fixed into or entangled in the membrane lining the throat and gullet; solid masses too large to pass on to the stomach; dry farinaceous materials which clog in the passage. The second class of causes consists in inflammation of the throat, or irritation of the organs of deglutition; constrictions of the passage, as in crib-biting horses; ulceration of the Œsophagus, which is apt to run after C., and is the cause of a relapse; lastly, without any disease of the deglutating organs, an animal may be choked by eating too greedily, and imperfectly masticating or salivating its food.

Symptoms.—These vary according to the position of the obstruction. If high up in the pharynx, the animal cannot swallow, evinces great distress, and attempts to cough up the object. Saliva drivels from the mouth, the animal chews, and makes an occasional ineffectual effort to swallow. The breathing is very greatly disturbed. In some cases a large lump of food has become fixed in the larynx or upper part of the windpipe, and has suddenly suffocated the animal. When the obstruction is in the course of the gullet down the neck, the symptoms are very similar, though less urgent, and there is addition-

ally the local sign of swelling, with the peculiar hardness or softness of the substance indicating its nature. When an animal is choked by a substance lodging in the gullet within the chest, the symptoms are more mysterious, and likely to mislead. The animal swallows; a considerable quantity of liquid may enter the gullet, but it is suddenly regurgitated or thrown up, as in the act of vomiting. The distress is great; and in the course of three or four days, unless the animal is relieved, it dies of prostration. In the ox, sheep, and goat, the most alarming symptoms, in any case of C. arise from the paunch becoming distended by gas. This condition will be treated under the head HOVEN.

Treatment.—Remove the obstruction with the hand, when you can. Cause the animal to swallow the substance, if possible, by giving it water or oil. Carefully push the offending agent down by a probang, if it is possible to effect this, and if withdrawal by the mouth is impracticable. In some cases, the gullet has to be cut into by a qualified surgeon. After a case of C., keep the animal on soft food, and attend to its general health, in order to avoid a relapse, which is of frequent occurrence in cattle.

CHOLAGOGUE (Gk. *cholos*, bile; *agein*, to lead), a cathartic medicine which increases the flow of bile. Cholagogue acts either by promoting the secretion of bile, or by facilitating the flow of bile from the gall-bladder into the duodenum, or by hurrying the bile through the intestines before it or its contents can be absorbed.

CHOLERA, a Greek term used in the Hippocratic writings, but of indeterminate etymology, being derived perhaps from *cholê*, bile, or from *cholera*, a water-spout or gutter. It is now universally employed in medicine as indicating one of two or three forms of disease, characterized by vomiting and purging, followed by great prostration of strength, amounting in severe cases to fatal collapse. The variety called *cholera sicca* (dry C.) by ancient writers (in which collapse and death take place without discharges) is comparatively rarely observed. The milder forms of C. occur almost every summer and autumn, even in temperate latitudes, and are hence termed by some—in reference to this country, and by way of contrast—British or summer C.; while the more devastating and fatal forms of the disease are generally supposed to originate only in tropical countries—especially in India—and thence to be propagated epidemically over vast populations, and in a somewhat regular geographical course, reaching this country usually through Persia, the steppes of Tartary, Russia, and the Baltic, at the same time extending to Egypt, Turkey, and the south of Europe. These very fatal forms of the disease are commonly called Asiatic, Oriental, or epidemic C.; sometimes cholera morbus, or pestilential cholera. The milder forms are sometimes also called bilious C.; and the severer, spasmodic C., from the character of the symptoms in each. Some writers of great authority are inclined to consider the two forms as one disease, varying in individual cases and according to season. It is certain that it is not always possible to distinguish the one form from the other in particular instances; but the marked difference between the mortality of groups of cases of British C. on the one hand, and of Oriental or Asiatic C. on the other, renders it probable that there is something in the latter disease which amounts to a distinction in kind. Whether in the milder or severer form C. is usually ushered in by a period of premonitory symptoms, when the more distinctive characters of the disease are not established; the case resembling one of common diarrhoea (q. v.) or looseness of the bowels. At this stage it is very apt to be neglected, and unfortunately, in the severer epidemic forms of the disease this is the only stage much under control. Whenever, therefore, there is a reasonable suspicion that epidemic C. is threatened, every person attacked with diarrhoea should make a point of placing himself under medical advice, and, if possible, of escaping from any situation in which epidemic disease is known to be prevalent. He should also be particularly attentive to diet, and especially to the purity of the water he drinks, and to its absolute freedom from contamination by animal matters filtering through the soil, or thrown into water-courses by sewers, etc. If water absolutely cannot be had in a pure state, it should be boiled before being used for drink, or indeed for any domestic purpose. Many cases of C., and several local epidemics, have been traced in the most positive manner to organic impurities of the drinking-water; and no single cause of the disease has been established by so much evidence as this. Hence, in all probability, arises the well-known preference of C. for low situations, and particularly for the low-lying flats on the banks of rivers, especially where the inhabitants are supplied with water from places polluted by sewerage.

It is hardly within the scope of a work such as this to present a minute description of fully developed C. in its severer or Asiatic variety. It is truly an appalling pestilence too easily recognized by a few leading features. After some hours or days of simple relaxation of the bowels, vomiting commences, and occurs again and again, accompanied by frequent and extremely copious discharges downwards, at first of matters colored with bile as usual, but in the end of colorless and turbid fluid resembling water in which rice has been boiled. These discharges (often to the extent of gallons of liquid), succeeding each other with the most alarming rapidity, act as a drain upon the fluids of the body generally; and by the changes they effect upon the blood, contribute to bring about the state called *collapse*. In this condition, the patient lies motionless and apathetic, except when tormented by cramps, which are of frequent occurrence; the surface is cold; the finger ends, lips and tip of the nose become livid; the eyes are deeply sunk in the sockets, and often bloodshot; the tongue is clammy; the breath without any sensible warmth when caught on the hand; the pulse is suppressed at the wrist,

the breathing extremely slow and feeble, the heart just audible through the stethoscope. Purging and vomiting have ceased; even the urinary secretion has dried at its source. In fact, all the vital processes are nearly brought to a stand, and unless reaction comes, a few minutes, or at most a few hours, suffice to bring life to a close. Reaction in the most favorable cases is gradual and without accident; it is not unfrequently, however, accompanied by fever, closely resembling typhus, and constituting, at least in the temperate zone, one of the chief dangers of the progress of cholera.

Medicine is almost powerless against C., except in the earliest stages, in which the treatment usually pursued in diarrhea (q.v.) has sometimes been found useful. Very remarkable temporary restorative effects have been found to follow the injection into the veins of dilute solutions of saline matter, resembling as nearly as possible the salts of the blood which are drained away in the discharges. In 1892, an American physician, Dr. Elmer Lee, introduced treatment by intestinal irrigation, which consists in washing out the lower bowel with soapsuds or some mild antiseptic by injection, the lower bowel being the seat of the cholera bacillus or *spirillum*. This treatment, tried by Dr. Lee in the Russian cholera hospitals, reduced the death rate from 50 per cent. to about 12 per cent. of all cases.

Several epidemics of cholera have occurred in the United States. In the spring of 1832, Irish emigrants brought it to Detroit by the way of Quebec. There, soldiers going to the Black Hawk war contracted it, and spread it through many of the Western forts. Finally, the epidemic reached New Orleans, where 6000 died out of a population of 55,000. It visited the country again in 1834, 1848, 1852, 1865, 1867, and 1873. The worst of these visitations were in 1848 and 1865. In 1892 a few sporadic cases occurred, owing to the immigration from Hamburg, which in that year suffered greatly from the cholera.

CHOLERA INFANTUM. A disease of infants characterized by intestinal disturbance more or less obstinate and dangerous. Opinion is unsettled in regard to the nature of the complaint, and it passes under different names in different countries. In this country, besides C. I. a common name for it is *summer complaint*, because it is essentially a disease of hot weather. Most British authorities describe it under the general head of diarrhea, others call it weaning brash, watery gripes, and choleric fever of children. In France it has various names, principally alluding to its location, as colenteritis, follicular enteritis, and gastro-intestinal catarrh, the latter name being also the one in most frequent use in Germany. But the disease as it is known in this country, and doubtless elsewhere, depends upon a variety of pathological conditions, which, however, may change from one to another during the progress of the case. The causes of the complaint are not completely settled, although all the authorities agree that hot and badly ventilated apartments and malaria generally are highly conducive to it. The older American physicians were, with Dr. Benjamin Rush, accustomed to call it infantile bilious remittent fever, and many of the cases which occur in those rural districts where remittent malarial influences prevail have much of the character of remittent fever, but in cities, particularly where the sewerage is bad, and the streets are suffered to be choked with decaying garbage, the diarrhea has more the character of that of typhoid fever, and many of the symptoms are of a general typhoid, that is, of a weak nervous character. Too high a heat maintained in the nursery, will, if continued, probably so alter the functions of secretion as to bring on the disease; especially if the diet is defective, as from poor milk, or the injudicious giving of solid articles of food. It sometimes comes on very suddenly, but is often insidious in its advances, deluding the mother and family with the idea that it is merely a temporary diarrhea that will soon pass away, or can easily be relieved. The attack, however, may commence with violent symptoms, and there will be much excitement of the circulation, with vomiting and purging. There is in all cases great weakness of the digestive and assimilative powers. Milk which has been given but a short time before is voided by the rectum in curds, mixed with greenish slime of various depths of color, and containing fibrinous shreds and gelatinous masses, indicating mucous inflammation, and having a peculiar and diagnostic odor. The evacuations are preceded by colic pains, often intense, the movement usually giving temporary relief. The abdomen may be quite full at first, but gradually, often rapidly, grows gaunt, with more or less rapid emaciation of the whole body. The child becomes peculiarly fretful and impatient, the expression of its features and its general appearance being highly diagnostic to the experienced observer. In advanced stages there is a withered, clammy appearance of the hands, arms and legs, peculiar to the disease. Without change of air or diet, or under bad treatment, the disease usually runs a rapid and fatal course, but sometimes, under fair but not decided treatment, the sufferer lies for several weeks, when, according to statistics, death is more likely than recovery. There is a considerable difference, according to the testimony of practitioners, in the mortality which occurs in the practice of different individuals. In some charitable institutions the deaths of cases of C. I. run as high as 70 per cent, even under as good hygienic regulations as may be had in a city, and many private physicians, from the result of their practice, place the percentage of deaths above 50 per cent. There are others, and they form a large portion of the profession, who maintain that under their method of treatment the

mortality is much less, ranging on an average from 10 to 25 *per cent.*, and even below this. All concur as to the importance of pure air and proper diet. Often the simple removal to a mountainous district will, alone, result in recovery; or even a change from hot to cold weather, without removal, will often produce decided relief. As the digestive functions are very much weakened, the food should be the most digestible which can be obtained, also nutritious. If the case be one in which the child is suckled by the mother, but there is reason to suppose that her milk disagrees with it, weaning may be advisable; but, as a rule, the mother's milk is the best food for a child under 14 months of age. When a child is fed from a bottle, beef tea, made either from fresh beef, or from beef extract, may be given with advantage. Farinaceous articles, such as farina, tapioca, corn-starch, and arrowroot, are, contrary to the ill-advised conclusions of many, not proper food for infants. The only article of the kind that ever ought to be given in a case of cholera infantum, is rice water, which, from its slight astringent properties, may sometimes be given in moderate quantities together with good milk and beef tea. The radical difference between physicians, in the medical treatment aside from hygienic measures, and aside from any reference to the different "schools" of medicine, consists in the degree of reliance to be placed upon opiates and astringents, or, in other words, upon palliative treatment, as distinguished from that which seeks to produce a decided change in the functions of the various secreting organs, a great majority of which are manifestly much deranged in the disease under notice. The bile is scanty and not of normal character, and the inflamed and highly irritated mucous membrane of many parts of the intestinal tract interferes greatly with the functions of the mucous glands of these parts. There has long been a discussion among physicians as to the therapeutical value of mercurial preparations, particularly as to calomel, and its power of influencing the secretion of the liver, and diminishing inflammation. It seems proper therefore to say that in the experience of the most successful physicians it is found that the administration of small and oft repeated doses of calomel in cases of C. I. is attended, as a rule, with decidedly beneficial results; so that in the course of two or three days, frequently in a few hours, a change takes place for the better in the character of the fecal evacuations and in the appearance of the patient. The administration of the calomel alone, given in a little pulverized sugar, slightly moistened and placed on the child's tongue, in quantities from one-twelfth to one-quarter of a grain, and repeated every two, three, or four hours, will often produce decided relief; but it is generally advisable, or necessary, also to give a slight opiate, such as paregoric elixir, and perhaps a few drops of the tincture or aromatic syrup of rhubarb. The calomel must be persisted in for several days after the evacuations have become natural, although not given so often. It is a rule, with but few exceptions, among physicians of experience, that an infant cannot be salivated. On the contrary, the child grows strong and hearty under the use of calomel in those cases when the secretions are much deranged and the system reduced. In doses sufficiently small it undoubtedly possesses the power of improving assimilation. Warm baths, or rather warm sponging, and general attention to cleanliness, and the preservation of an equable temperature, should not be neglected.

CHOLESTERINE is one of those bodies which are termed by chemists lipoids, or non-saponifiable fats. It was originally discovered in gall stones, but is now recognized as an ordinary constituent (although occurring in very minute quantity) of bile, blood, and the tissue of the brain. It likewise occurs in pus, the contents of cysts, and other morbid fluid products.

It separates from its solutions in glistening nacreous scales, which, when examined under the microscope, appear as very thin rhombic tablets, whose obtuse angles are $100^{\circ} 30'$, and whose acute angles are $79^{\circ} 30'$. Different formulæ have been assigned for its composition, the one generally accepted being $C_{26}H_{44}O \cdot H_2O$. It is not always very easy of detection in animal fluids, but if, by its insolubility in water, acids, and alkalies, and its solubility in hot alcohol and ether, it has been recognized as a fatty substance, it may be readily distinguished from all similar substances by the measurement of the angles of its rhombic tablets. The best method of preparing C. is by boiling gall-stones containing it in alcohol, and filtering the solution while hot. From this hot filtered solution it crystallizes as the fluid cools.

Chemists have obtained substances known as *cholesterilins* and *cholesterones* from the decomposition of cholesterol.

CHOLET, a t. of France, in the department of Maine-et-Loire, on the right bank of the Maine, 32 m. s.w. of Angers. Here, during the Vendean war, two actions were fought in 1793, in both of which the royalists were defeated. In the first, they lost their brave Gen. Bonchamps; and the second drove them across the Loire, thus virtually deciding the war against them. It has manufactures of fine woolen and mixed fabrics, and leather, and a trade in cattle. Pop. of commune, '91, 16,891.

CHOLIAMBIC. See METRICAL FEET.

CHOLULA, a once flourishing, but now decayed, t. of Mexico, 60 m. to the e.s.e. of the capital, and 15 to the w.n.w. of La Puebla. Cortes found in it 20,000 houses, and as many more in the suburbs, and also 400 temples. Now the place contains only about 6,000 inhabitants. Its most remarkable memorial of aboriginal times is a pyramid of

clay and brick, surmounted on the top by a chapel of Spanish origin. Its height is 177 ft., while the side of its base measures 480 yards. C. stands on the table-land of Anahuac, at an elevation of 6,912 ft. above the level of the sea.

CHONDRINE. See GELATINE.

CHONDROPTERYGII. See CARTILAGINOUS FISHES.

CHONETES, a genus of fossil brachiopodous mollusca, nearly allied to the well-known genus *productus*. It is characterized by its transversely-oblong shell, and by having the long margin of the ventral valve armed with a series of tubular spines. Twenty-nine species have been described from the paleozoic formations. See *illus.*, SILURIAN AND DEVONIAN FOSSILS, vol. XIV.

CHONOS ARCHIPELAGO, a group of islands off the west coast of Chile, lat 44° to 46° s., long. 74° to 75° west. With the exception of a few of the most westerly, all are bare and scantily peopled, though several are of considerable extent.

CHONS, or **KHONSOU**, an Egyptian deity worshiped at Thebes as the great eldest son of Amen-Ra and Mut, and identified with the moon. The Greeks thought him to be a form of Hercules. Like Horus, he is represented as a youthful god, his form mummied, wearing the lock of hair at the right side of his head, and a skull-cap surmounted by the full and dichotomized lunar disk; or hawk-headed, wearing the same. He holds a crook and whip. He was a celestial deity, and at a later time connected with Thoth, and was said to have proceeded from Nu or Han, the celestial waters. A tablet found in a temple at Karnak which was dedicated to this god, records the departure of C. in his ark in the 16th year of the reign of Rameses XII. to the land of Baktan to expel a demon which had possessed the daughter of a king of that country and sister of the queen of Egypt. He succeeded, and returned in his ark 17 years later. The worship of C. appears to have been common in the Ptolemaic period, and figures of the god in porcelain and bronze are not uncommon. He represents the youngest, as Ammon did the oldest, of the divine circle.

CHONTALES, a district of Nicaragua, n.e. of lakes Nicaragua and Managua, traversed by the Cordilleras, along the slopes of which are valuable mines. There are a number of small towns peopled chiefly by native Indians. Some of the gold mines now worked by them were worked by the early Spanish adventurers. There is a bed of coal near lake Nicaragua. The grassy plains among the mountains support large herds of horses and cattle. Tropical fruits grow abundantly.

CHOPIN (FRANÇOIS), FRÉDÉRIC, composer, was born in Zela Zowa Wola, near Warsaw, Poland, March 1, 1809; and died in Paris, Oct. 17, 1849. His father, Nicholas, a Frenchman, settled in Warsaw, where he taught at the Lycée, and afterwards conducted a private school; and his mother, Justine Kryzanowska, was a Pole. Chopin was educated by his father, and studied music under Zywny and Joseph Eitner. At the age of nineteen he was a virtuoso on the pianoforte, and had composed many dances. In 1828 he gave concerts in Vienna and Munich on his way to Paris, where he became a favorite in artistic circles, numbering among his followers the young Liszt. Chopin gave his life to teaching and composing, and played but little in concerts. As a pianist he was noted for his brilliancy, grace, and depth of sentiment, and capriciousness in time and rhythm. With the exception of a winter in Majorca with George Sand, in 1838, and visits to England and Scotland, in 1848-49, Chopin passed his time after 1830 in Paris, and is buried at Père la Chaise, between the graves of Bellini and Cherubini. In 1836 Liszt introduced him to George Sand, with whom he made a liaison that lasted until about 1846, when, after distorting his character in her novel, *Lucrezia Floriani*, as Prince Karol, she grew tired of him. Schumann's opinion of Chopin in music was that of "the boldest and proudest spirit of the times." He wrote almost entirely for the pianoforte, and his compositions have never been excelled. They stand alone, and are adapted to the nature of the instrument, strong and exquisite in sentiment, delicate and poetic in fancy, original in rhythm, and rich in tone-color. The polonaises, mazurkas, and valse contain many effects of Polish national music blended with French culture and taste. Chopin's works include 2 Concertos in E minor, op. 11, and F minor, op. 21; Allegro de concert, op. 46; 4 Ballades, Barcarolle, Berceuse, Bolero; 3 Ecossaises, 12 Grandes Etudes, 15 Études, 4 Fantasiaes, 3 Impromptus, Marche funèbre, 52 Mazurkas, 19 Nocturnes, 12 Polonaises, 24 Préludes, 5 Rondos, 4 Scherzos, 4 Sonatas, 13 Valsees; Tarentelle; Trio for pianoforte, violin, and violoncello; Variations; and 16 Polish songs for one voice with pianoforte. See Liszt, *Chopin* (Paris, 1852); Barbedette, *do.* (Paris, 1869) and Karasowski, *Friedrich Chopin, sein Leben* (Dresden, 1877).

CHOPINE (Spanish, *chopin*), a high clog, or slipper, deriving its name, as is supposed, from the sound *chap*, *chop*, made by the wearers in walking. Chopines were of eastern origin, but were introduced into England from Venice during the reign of Elizabeth. They were worn by ladies under the shoes, and were usually made of wood covered with leather, often of various colors, and frequently painted and gilded. Some of them were as much as half a yard high; and in Venice, where they were usually worn, their height distinguished the quality of the lady. The C. is mentioned by Shakespeare in *Hamlet*.

CHOPTANK RIVER rises in Delaware, and flows s.w. through that state and Maryland, forming a wide estuary as it nears Chesapeake bay, into which it empties. It is navigable for small vessels for about 50 miles.

CHORAGIC MONUMENTS. The choragus, or person at Athens who, on behalf of his tribe, had supported the chorus (q.v.), and who, in competition with the other tribes, had exhibited the best musical or theatrical performance, received a tripod for a prize; but he had the expense of consecrating it, and of building the monument on which it was placed. There was at Athens a whole street formed by these monuments, called the "street of the tripods." A fine specimen still remaining is called "the choragic monument of Lysicrates."

CHORAGUS. See **CHORUS**.

CHORALE', a musical term adopted from the German, means a melody to which sacred hymns or psalms are sung in public worship by the whole congregation in unison. The melody of the C. moves in notes of a slow and strictly measured progression, and of a solemn and dignified character that disposes the mind to devotion. Although the term C. is now always applied to the music of the Protestant church, it belonged to the Christian church at all times, as melodies still in use can be traced with certainty to have been sung by the congregations in the first centuries of Christianity. Among these is the song of praise by St. Ambrose, still retained in the Lutheran church, to the words "Herr, Gott, dich loben wir." The C. is intimately connected with the history of music, as vocal music was the only kind used in worship until far on in the middle ages. The C. is precisely what our psalm-tune is, or rather what it formerly was, and ought again to become. The pure, simple C. has, in a great degree, been cast aside in modern times, and its place occupied by tunes of a comparatively puerile style, which are frequently only adaptations of operatic songs and other profane pieces.

CHORAL MUSIC, the ancient music of the church. Music in parts for different voices. See **SACRED MUSIC**.

CHORAL SERVICE, the musical service of the Catholic church, celebrated by a full complement of clergymen and choristers in a cathedral church, and when all those parts of the service are sung as ordered in the rubrics.

CHORD. The C. of an arc of a curve is a straight line joining its two extremities. A **SCALE OF CHORDS** is used in laying off angles. It is thus constructed: Let AB be

the radius of the circle to which the scale is to be adapted. With center A and radius AB describe a quadrant BEC. Divide the quadrantal arc BEC into nine equal parts BD, DE, etc. This may be done by taking a radius equal to AB, and from the centers B and C cutting the arc in G and F. As the radius is always equal to the chord of 60° or $\frac{1}{2}$ of a quadrant, the arc CB is thus divided into three equal parts, BF, FG, GC, and each of these parts may then be trisected by trial, as no direct method is known. Draw the chord of the quadrant BC; from B as a center, and the chord of BD as a radius, describe an arc cutting BC at 10; with the chord of BE as a radius, describe an arc cutting BC in 20; with the chord of BF, describe an arc cutting BC in 30; and in a similar manner, find the divisions 40, 50, 60, 70, 80. Then the arcs BD, BE, BF, being arcs of 10°, 20°, 30°, etc., respectively, the distances from B to 10, 20, 30, etc., are the chords of arcs of 10°, 20°, 30°, etc.; so that BC is a scale of chords for every 10°, from 0° to 90°. To lay down or measure angles with such a scale, the arc of measurement must be described with the chord of 60°.

CHORD, in music, is the simultaneous union of different sounds, at first intuitively recognized by the ear, and afterwards reduced to a science by the invention of the laws or rules of harmony. See **HARMONY**. Chords may consist of from two to five parts. Absolute chords of two parts are produced only by thirds or sevenths. Chords of more than two parts are either fundamental chords or inversions of them, and are divided into concords and discords. The union of sounds in all chords will be found, on analyzing their component parts, to be an admixture of major and minor thirds. The common chord, or triad, is the basis of all harmony, and con-

sists of a bass note, or prime, with its third and fifth above, thus: These

three sounds are at the distance of a third from each other. When the lowest third is the greater third, as above, the C. is a major chord; but when the lowest third is the lesser,

thus: the C. is called a minor chord. A chord of two minor thirds com-

bined is called diminished, as the interval from the lowest note to the highest is less than

a perfect fifth, thus: The common C. admits of two inversions, accord-

ing as one or other of its notes is made the bass, or lowest note of the C., thus:

Fundamental Chord. 1st inversion. 2d inversion.

By adding another third above the common C., a C. of four parts is produced, which is called the chord of the seventh, because the highest note is a seventh above the bass. When the C. of the seventh is produced on the fifth of the scale, it is then called the dominant seventh, which is the most perfect species of the C. It then consists of a major third, perfect fifth, and minor seventh, which is the next harmonic produced by nature above the fifth. The C. of the seventh may also be formed on any of the notes of the major or minor scale taken as a bass note, which produces the varieties of major, minor, and diminished sevenths, thus:

Dominant 7th. Major 7th. Minor 7th. Diminished 7th.

The C. of the seventh admits of three inversions, according as the notes above the fundamental note are used as bass notes. From its nature, it requires a resolution, and is therefore always followed by a common C. whose fundamental bass is a fifth below that of the seventh. For the C. of the ninth, see HARMONY. The first proper arranged system of chords is by Rameau, in 1720, which has from time to time been extended and improved by Marpurg, Kirenberger, G. Weber, F. Schneider, Marx, and the late professor S. W. Dehn of Berlin.

CHOREA (Gr. *chorea*, a dancing or jumping), a disease popularly called St. Vitus's dance, and consisting of a tendency to involuntary and irregular muscular contractions of the limbs and face, the mind and the functions of the brain generally being quite unaffected. The spasms of C. differ from those of most other convulsive affections in being unaccompanied either by pain or by rigidity; being, in fact, momentary jerking movements, indicating rather a want of control of the will over the muscles, than any real excess of their contractions. In some cases, the disease resembles merely an exaggeration of the restlessness and "fidgetiness" common among children; in others, it goes so far as to be a very serious malady, and may even threaten life. Fatal cases, however, are fortunately very rare, and in the large majority of instances the disease yields readily to treatment carefully pursued, or disappears spontaneously as the patient grows up. C. is a disease much more common among children of 6 years old, and upwards, than at any other period of life; it is also more common among female children than among males. The treatment generally pursued is the use of metallic tonics, such as zinc, copper, iron, and arsenic (the last, perhaps, the best), sometimes preceded or accompanied by purgatives. Exercise in the open air is also to be recommended; and gymnastics afford material aid in the cure. It is to be observed that the name St. Vitus's dance (dance of St. Weit) was applied originally in Germany to a different form of disease from that above referred to—one closely approaching in its characters the epidemic "dancing mania," which, in Italy, was called tarantism (q.v.).

CHOREA SCRIPTORUM. See SCRIVENER'S PALSY.

CHOREE. See METRICAL FEET.

CHOREPISCOPI, an order of ministers of ancient origin, whose functions were to assist city bishops in rural districts or remote places. They acted in a subordinate capacity, and possessed limited powers, acting as colleagues or vicars of the bishops. They possessed the privilege of attending councils in their own right, and not merely as substitutes for bishops. At first they were confined to the eastern church, but began to multiply in the western church in the 5th century. They were succeeded after the 10th c. by archdeacons, vicars-general, and rural deans. In the east the order was abolished by the council of Rodicea about 365 A.D.

CHORIAMBUS. See METRICAL FEET.

CHORLEY, HENRY FOTHERGILL, 1808-72; an English author who paid much attention to musical criticism. After long effort he got a position on the London *Athenæum*, and for 35 years conducted the musical department of that journal. He wrote on other subjects besides music, producing the librettos of the *Amber Witch*; the *May Queen*; *St. Cecilia*; *Kenilworth*; *The Sapphire Necklace*; and *Faust*. Other of his works are. *Conts the Discarded, and Other Tales*; *Sketches of a Seaport Town*; *Memorials of Mrs. Hemans*; *Lion, a Tale of the Coteries*; *Music and Manners in France and Germany*; *Pomfret*; *Criticisms on Modern German Music*; and *Thirty Years' Musical Recollections*.

CHOROID COAT. See EYE.

CHORUS, among the ancients, meant a band of singers and dancers employed on festive occasions of great pomp, and also in the performance of tragedy and comedy

on the stage. In the time of the Attic tragedy, the C. consisted of a group of persons, male and female, who remained on the stage during the whole performance as spectators, or rather as witnesses. When a pause took place in the acting, the C. either sang or spoke verses having reference to the subject represented, which served to increase the impression or sensation produced by the performers. At times, the C. seemed to take part with or against the persons in the drama, by advice, comfort, exhortation, or dissuasion. In early times, the C. was very large, sometimes consisting of upwards of fifty persons, but afterwards it was much reduced. Its leader was termed the *coryphæus*. The charge of organizing it was considered a great honor among the citizens of Athens. The person appointed for this purpose was called the *choragus*. The honor was very expensive, as the choragus had to pay all the expenses incurred in training the members of the C. to perform their parts efficiently. They were, besides, fed and lodged by him during training-time, and he had also to provide for them masks and dresses. At times, the C. was divided, and spoke or sang antiphonally. These divisions moved from side to side of the stage, from which movement originated the naming of the single songs or stanzas, such as strophe, antistrophe, and epode. How the musical element of the ancient C. was constituted or composed, is not known with any certainty. Possibly, it was only a kind of rhythmical declamation, and doubtless very simple. It was accompanied by flutes in unison. With the decline of the ancient tragedy, the C. also fell into disuse; and only lately has there been an attempt to produce the same on the stage in the manner of the ancients, as, for example, in Schiller's *Bride of Messina*. The music which has been set in modern times to some of the Greek tragedies, does not give the least idea of the original music.

In modern times, by C. is understood the union of singers or musicians for the joint performance of a musical work. C. is also the name given to a musical composition for numerous voices, either with or without accompaniment, and intended to express the united feelings of a multitude. The musical C. is the only artistic means by which a simultaneous movement or sentiment of a multitude can be represented in the drama, the language or text being always of a simple rhythm, permitting only of a limited movement suited to the combination of a multitude. It is, however, not always necessary that every part of the C. should manifest the same feeling or sentiment. Two or more parts of the C. may act against each other, as suits the purport of the drama. Double, triple, and quadruple choruses are found in the old Italian compositions for the church. In modern times, the C. is much used, and with great effect, in operas, especially those of Meyerbeer and Wagner. In oratorio, the C. is of the greatest importance, and the numbers now employed to sing the C. far exceed anything attempted a century ago; but this is not always an advantage, for the *tempi* must necessarily be taken much more slowly, which has a sluggish effect; while increase in the number of voices does not always produce a greater power of sound. The C. of 35 well-trained voices from the pope's chapel, who sang at the coronation of Napoleon I., in the cathedral of Notre Dame, Paris, produced a far greater and more wonderful effect when they entered singing the *Tues Petrus*, than another C. of hundreds of voices, and 80 harps, that had been assembled and trained for the same occasion, in expectation of surpassing all that man could imagine. The greater the number, the greater is the difficulty in obtaining unity.—C., in organ-building, is the name given to stops of the mixture species, some of which contain 2, 3, 4, 5, 6, or more pipes to each note, tuned at consonant intervals in relation to the fundamental stops.

CHOSE IN ACTION, in the law of England, is that kind of property which consists not in possession, but in the legal right to possess. As this right can, in general, be vindicated and made available only by means of an action, the property to which it relates, whether real or personal, is called a thing (*res* or *chose*) in action, to distinguish it from a thing already in possession. Money due upon bonds and bills, goods bought and not yet delivered, are examples of choses in action, as is also the right to compensation for damage occasioned by breach of contract. "By the strict rule of the ancient common law, no chose of action could be assigned or granted over, because it was thought to be a great encouragement to litigiousness, if a man were allowed to make over to a stranger his right of going to law. [See *CHAMPERTY*.] But this nicety is now not so far regarded as to render such a transaction really ineffectual. It is, on the contrary, in substance, a valid and constant practice; though, in compliance with the ancient principle, the form of assigning a chose in action is in the nature of a declaration of trust, and an agreement to permit the assignee to make use of the name of the assignor, in order to recover possession. . . . The king is an exception to this general rule, for he might always either grant or receive a chose in action by assignment." The law relating to *choses in action* was formerly the same in the U. S. as in Eng. But in many states, as in N. Y., the assignee of a *chose in action* is now allowed to sue upon his right in his own name. The assignee of a *chose in action*, however, takes it subject to all defenses which might have been interposed to it had the action been brought upon it by the original owner.

CHOSON. See **COREA**.

CHOSROES. See **KHOSRU**.

CHO'TA NAGPORE, or **NAGPORE THE LESS**, a division of Bengal, British India. The area of the division is 26,966 sq. m., and in 1891 the pop. was 4,628,792. It contains five districts, and in the w. or s.w. part is occupied by several minor tributary states. The inhabitants of this region are semi-barbarous, but there are many traces of an early civilization. The country is for the most part wild and hilly, consisting of an undulating plateau 3,000 ft. above the sea. Its chief products are coal, jute, tea, and indigo; iron is also found.

CHOTEAU, a co. in Montana, on the Canadian border, near the head-waters of the Missouri river, drained by the Missouri, the Dog, Milk, Arrow, Teton, Judith, Bear, and other rivers; about 27,280 sq. m.; pop. '90, 4781, besides Indians. Co. seat, Fort Benton.

CHOTEAU, a co. in northwestern S. Dakota; 870 sq. m.; pop. '90, 8. It is drained by affluents of Moreau river.

CHOTYN, **KHOTIN**, or **CHOCZIN**, a t. in Bessarabia, on the river Dniester, 45 m. s.w. of Kamieniec; pop. about 21,000. It is a fortified military post, and once belonged to the Turks, but was taken by the Russians in 1739.

CHOUANS were bands of insurgent royalists, who, during the French revolution, organized a reactionary movement in Brittany. They obtained their name from their leader, Jean Cottereau. This person, who had been a smuggler, went by the name of Chouan—a corruption, it is said, of *chat-huant* ("screech-owl")—because, while he and his accomplices were engaged in their nocturnal work, they were wont to be warned of their danger by some one on the watch imitating the cry of this bird. At the period of the revolt, however, he followed the humble occupation of a clog-maker. The first indications of an anti-revolutionary spirit in Brittany manifested themselves in the beginning of 1791, when several trees of liberty were destroyed at night, and other more serious outrages committed. These disturbances were fomented by seditious priests. In 1792, an insurrection was planned by the marquis de la Rouarie, with the sanction and approval of the two brothers of Louis XVI. The agents of the marquis entered into communications with Jean Cottereau—well known for the reckless audacity of his character—and other smugglers; but having the misfortune to be arrested, the carrying out of the insurrection devolved upon the latter. The *Chouanerie*, as the insurrection was called, at first disgraced itself, both by the drunken license and the cruelty which marked it. After several successful exploits of the guerrilla sort, Jean Cottereau perished in an engagement which took place on the 28th July, 1794, near the wood of Mison, the theater of his first efforts. Before this, however, other and more illustrious leaders had appeared in Brittany to direct the movement, the chief of whom were Georges Cadoudal (q. v.) and Charette. Through their endeavors it was more widely extended, and for a time seemed likely to imperil the security of France, but was suppressed towards the close of 1799. Petty *spurts* of insurrection, however, broke out till about 1803, when the *Chouanerie* ceased for awhile. In 1814-15, it again made its appearance on both sides of the Loire; and after the July revolution, was once more excited by the duchess of Berry on behalf of the duke of Bordeaux, but crushed by the energetic measures taken by M. Thiers, in 1830.

CHOUGH, *Fregilus*, a genus of birds of the crow family (*corvidæ*), but approaching to the characters and appearance of the starlings (*sturnidæ*). The length of the bill has induced some naturalists, among whom was Cuvier, to place them beside the hoopoes' but this is now generally regarded as an error; they agree with crows in having their nostrils covered with stiff bristles directed forward, and in their habits. The beak is longer than the head, strong, arched, and pointed. The tail is slightly rounded. The only European species is the common C., sometimes called the Cornish C., or red-legged crow (*F. graculus*), a widely distributed but very local bird, inhabiting the Swiss Alps, the high mountains of Spain, of Greece, of India, and of Persia, the s. of Siberia, the n. of Africa, and some parts of the British sea-coasts; but almost exclusively confined to situations where there are high cliffs. In these it generally makes its nest; sometimes, however, in ruined towers. Its long hooked claws enable it to cling easily to a rough rock, but it seems unwilling even to set its feet on turf. It lives in societies like the rook. It feeds on insects, berries, grubs, and grain. It is easily tamed, becomes very familiar and forward, and exhibits in the highest degree the curiosity, the pilfering disposition, and the delight in brilliant or glittering objects, which also characterize others of the crow family.—Other species of C. are known, natives of Australia, Java, etc. See *illus.*, DEER, ETC., vol. IV.

CHOULES, JOHN OVERTON, D.D., 1801-56; a native of England, who emigrated to the United States in 1824. In 1827, he became minister of the Second Baptist church in Newport, R. I. Six years later, he went to New Bedford; in 1837, to Buffalo; in 1841, to the Sixth street Baptist church in New York; and in 1843, to the church at Jamaica Plain, near Boston. In 1847, he returned to his Newport church; and in 1854, accompanied Commodore Vanderbilt in his yacht voyage to Europe. Among his publications are *Young Americans Abroad*, and *The Cruise of the North Star* (the commodore's yacht). He also contributed to and edited several historical works.

CHOUTEAU, AUGUSTE, 1739-1829; a native of New Orleans, and a pioneer in north-western settlements. With his brother Pierre he was the founder of the present city of St. Louis.

CHOUTEAU, PIERRE, 1749-1849; brother of Auguste, and with him the founder of St. Louis, where they settled in 1764. The two were members of an expedition under Laclede, sent by the French government of Louisiana to open trade in the region of the Missouri and upper Mississippi. The brothers remained in St. Louis all their lives, Auguste reaching 90 and Pierre 100 years of age. They were the heads of large families of high standing and great wealth and influence in Missouri and adjoining states.

CHOUTEAU, PIERRE, 1789-1865; son of Pierre the founder of St. Louis. He was all his life engaged in the fur trade, following the Indian tribes as they retired before white encroachment, and establishing trading-posts in many remote points. In 1834, he and his associates bought the fur-trade interests of John Jacob Astor, and extended their operations over all the regions e. of the Rocky mountains down to Mexico. Chouteau was a member of the convention that framed the first constitution of Missouri.

CHOWAN, a co. in n.e. North Carolina, on Albemarle sound, and bounded w. by Chowan river; 220 sq. m.; pop. '90, 9167, includes colored. The surface is uneven, and the soil fertile, producing corn, cotton, etc. Co. seat, Edenton.

CHOW-CHOW (strictly an adjective, meaning "mixed," "miscellaneous," "broken"), a name most commonly used to denote a kind of mixed pickles, made originally in the East Indies, but now imitated elsewhere. Among its principal ingredients may be mentioned pickles, onions, cauliflower, and beans, all of which are steeped in mustard. A kind of Chinese sweetmeats, consisting of odds and ends of orange peel, ginger, bamboo, syrup, pumelo rind, etc., is called chow-chow.

CHOWDER. In the fishing villages of Brittany (according to a writer in *Notes and Queries*, 4, Ser. VII., 85), *faire la chaudière* is to provide a caldron in which is cooked a mess of fish and biscuit with some savory condiments—a hodge-podge contributed by the fishermen themselves, each of whom in return receives his share of the prepared dish. The French would seem to have carried this practice to America, first to Newfoundland, whence it spread to Nova Scotia, New Brunswick, and New England. Chowder is described nowadays as "a many-sided dish, of pork and fish, potatoes and bread, onions and turnips, well peppered and salted, piled up in layers and stewed together." Cider is sometimes added. New Englanders are not alone in their appreciation of this dish. Picnic parties to the seashore not unfrequently prepare a chowder from clams or fish which they catch themselves. Such a picnic is itself called a *chowder*. The best known form of chowder is *clam chowder*, so called because clams form one of the principal ingredients. Another variety is *eel chowder*. See Schele De Vere's *Americanisms*, page 344.

CHRESTOM'ATHY, a collection of extracts, or text books, useful in learning a language, or in gaining special information.

CHRISM (Gr. *chrisma*, ointment) is the name given to the oil consecrated on holy Thursday, in the Roman Catholic and Greek churches, by the bishop, and used in baptism, confirmation, orders, and extreme unction. There are two kinds of C.—the one, a mixture of oil and balsam, is used in baptism, confirmation, and orders; the other, which is merely plain oil, is used in extreme unction.

CHRISOME, the name of the white vesture laid by the priest on the child in former times at baptism, to signify its innocence. It was generally presented by the mother as an offering to the church, but if the child died before the mother was "churched" again, it was used as a shroud. By a common abuse of words, C. came to be applied to the child itself. A C. child is a child in a C. cloth.

CHRIST, a title of our Savior (see Jesus), now in general use almost as a name or as part of his name. It is originally Greek, signifies *anointed*, and corresponds exactly in meaning and use with the Hebrew word Messiah (q.v.); so that this title given to Jesus of Nazareth, is an acknowledgment of him as the Savior long promised to the house of Jacob and to the human race. As prophets, priests, and kings were anointed on being called to their several offices (I Kings i. 34, 39; I Sam. xvi. 13; Exod. xxix. 7), so the Savior was anointed as at once prophet, priest, and king; the Holy Spirit, often represented under this figure, being given to him to qualify his human nature for all that belonged to his mediatorial office and work.

The whole system of Christianity depends on the doctrine of the PERSON OF CHRIST. An essential difference necessarily exists on almost every point between the systems of doctrine maintained by those who do and by those who do not acknowledge a union of the divine and human natures in his person. Some of the early heretics maintained an opinion, which has long ceased to have any supporters, that the body of C. was not a real body, but a mere visionary appearance. See DOCTÆ and GNOSTICS. The opposite extreme is that of Socinians, by whom C. is regarded as a mere man; whilst Arians (see ARIUS) regard him as in his *pre-existence*—i.e., before his *incarnation*—the highest of all created beings; and according to the generally received doctrine of Christians, he is "God and man in two distinct natures and one person." This doctrine, of course, bears a most intimate relation to that of the Trinity (q.v.); and all who hold the divinity of Jesus Christ, regard him as the incarnate second person of the godhead. The proof of the whole doctrine may almost be said to consist simply in a proof of the *divinity* of C.; his real *humanity*, although equally important, being no longer disputed. And this

proof is found, not so much in particular texts which directly assert the divinity of C.—although such texts are important—as in the multitude of texts which imply it, and admit of no reasonable or natural explanation apart from it; and in showing that certain doctrines are taught in Scripture which cannot be maintained without this.

The ancient Apollinarians, Eutychians, Monophysites, etc., regarded C. as having only one nature—a *compound* of the divine and human; but such a notion as that C. had only a human body, the divine nature supplying the place of a soul, is held to be subversive of the whole Christian system; and his human nature, to be real, must be viewed as consisting both of a true body and a true soul. His human nature never existed, however, apart from his divine nature, and was “conceived by the power of the Holy Ghost.”

Closely connected with this subject is that of the *humiliation* and consequent *exaltation* of C., in his character of mediator between God and man; a subject, to the former branch of which belongs the whole doctrine of the *work* of C. for the redemption of sinners, including the great doctrine of atonement (q.v.). To the latter belongs the doctrine of the reward of his work, in his sitting at the right hand of God, and having all things put under his feet; not only exercising dominion as king in his church, but over all things for the advancement of the salvation of his church, and of every member of it; while also he sends forth the Holy Spirit to apply to men the blessings which, as the reward of his work, he has mediatorially obtained for them; and still continuing to act as a priest, makes continual intercession (q.v.), founded upon his work and sacrifice.

CHRIST, ORDER OF, IN PORTUGAL. When the Templars were expelled from France, and their property confiscated by Philippe le Bel, with the sanction of Pope Clement V., they were received into Portugal, and their order revived in 1317, under the title of “The Order of our Lord Jesus Christ.” With some difficulty, Pope John XXII. was induced to sanction the new order. The knights of the order of Christ joined the Portuguese in all their crusades against the infidel, and also in their African and Indian expeditions, receiving in compensation continual additions to their own possessions. The grand prior of the order was invested by pope Calixtus III. with power equal to that of a bishop; and as an encouragement to adventure, the knights were promised all the countries which they might discover, to be held under the protection of Portugal. At length, their wealth and power excited the jealousy of the kings of Portugal; their future acquisitions, and, subsequently, even their actual possessions, were declared to be crown possessions, and the offices of administrator and grand-master were transferred to the crown. A fine cloister belonging to the order is still to be seen at Tomar, to which place the seat of the order was transferred from Castro-Marino in 1366. Noble descent, and three years’ military service against the infidel, were required for admission. The members took the three monkish vows of chastity, poverty, and obedience, till the pope released them from the first two, on condition of their applying the third part of their revenues to the support of Tomar cloister, the priests of which were bound by the three vows. This cloister is now a theological institution for the instruction of the priests of the order.

It is said that the order still possesses 26 villages and farms, and 434 prebends. It is very numerous—consisting of 6 knights of the grand cross, 450 commanders, and an unlimited number of knights. Catholics of noble descent alone are admitted, and foreigners are excluded from participation in the revenues, being exempted in return from its rules.

CHRIST, PAPAL ORDER OF. This is a branch of the Portuguese order, created by Pope John XXII. It has only one class.

CHRIST, PICTURES OF. To represent the form and countenance of C. in a manner that shall even approximate to the latent ideal in the minds of men, is unquestionably the most sublime and the most difficult work which an artist can undertake. It is the highest pictorial effort of the creative faculty. From a very early period in the history of the church, we can trace the growth of the endeavor. At first, indeed, the horror entertained for the idols of the pagans, must have inspired Christians with an aversion to images or pictures of the Savior. Gradually, however, as paganism disappeared, and time removed C. further from his people, this feeling would subside, and the longing would arise to possess some representation of him on which the eye might rest with pious delight. When Christian art originated we cannot precisely say; it is usually dated from the time of Constantine. Nevertheless—as lord Lindsay remarks, in his *Sketches of the History of Christian Art* (Lond. 1847)—“it would be more correct to say that it then first emerged above ground; its earliest efforts must be sought for in the catacombs.” In these subterranean excavations, forming a maze of unknown extent and labyrinthine intricacy, to which the Roman Christians had recourse in the days of persecution, are to be found the first traces of Christian sculpture and painting. The *sarcophagi* of the martyrs and confessors, of the heroes and heroines, of the bishops, and, in general, of those of higher mark and renown, were painted over with the symbols and devices of Christianity. The parables were the chief source from which these sepulchral artists drew their symbols. C. is painted as the good shepherd in the midst of his flock, or, with “pastoral pipe,” seeking the lost sheep, or returning with it on his

shoulders. Sometimes he figures as an ideal youth in the bloom of his years, sometimes as a bearded man in the prime of life, sometimes as Orpheus surrounded by wild beasts enrapt by the melody of his lyre. Such pictures, however, were only *symbolical*, and did not satisfy the religious craving for a *portrait*. The age of Constantine marks the transition from the symbolical to the *pseudo-historical* picture. We now find C. represented in the midst of his disciples, or in the act of performing a miracle; but it is not till about the close of the 4th c. that we actually encounter that type of countenance which, with certain modifications, continued to rule the conceptions of artists during the whole of the middle ages. To vindicate this type, myths, at a later period, sprang into existence; and we read of a portrait of C. possessed by King Abgarus of Edessa, and imprinted on a handkerchief, and of another miraculously obtained by St. Veronica at the crucifixion; but there is as little foundation for these legends as for that which attributes to the evangelist Luke such a picture. The emperor Alexander Severus (230 A.D.) is said to have possessed in his palace an image of Christ. An antique mosaic, probably of the 3d c., which exists in the *Museo Cristiano* of the Vatican—where are to be found also some specimens of the frescos of the catacombs—gives an idea of the manner in which the heathen artists expressed their notion of Christ. He is depicted as a bearded philosopher in profile. A letter which Lentulus, the predecessor of Pilate, is declared to have written to the Roman senate, but which is evidently apocryphal, attributes to C. a figure and countenance of manly beauty. Towards the middle of the 8th c., John of Damascus gives a description which he pretends to have gathered from more ancient authors. According to him, C. was tall, had beautiful eyes, but the eyebrows meeting; a regular nose, flowing locks, a black beard, and a sandy or straw-colored complexion, like his mother. Among the most ancient representations of C. which profess to be portraits, are the two paintings in the Calixtine and Pontine catacombs near Rome, and which are given in Arighi's *Roma Subterranea Nova*. The Savior is there represented with an oval visage, a straight nose, arched eyebrows, and high forehead. The expression is earnest and mild; the hair is parted on the forehead, and falls over the shoulders in waving locks; the beard is short and scattered. These two busts agree with the apocryphal letter of Lentulus, and the artist or artists who executed them, may possibly have employed it as a model. The majority of the Byzantine and Italian painters, down to the age of Michael Angelo and Raphael, adhered to this type.

CHRIST or **CRIS CROSS ROW**, the alphabet arranged in the form of a cross, for the use of children; and so printed, in old "horn" books, or primers. The letter A was at the top, and Z at the foot of the cross. See **HORNBOOK**.

CHRISTADELPHIANS, a religious sect in America, organized about 1844, whose principles are thus stated: The Old and New Testaments are equally important; God will restore to immortal life all who love him in this life, but those who have not accepted this immortal principle cease to exist at death; there is no personal devil; Christ is the son of God, deriving from the Deity moral perfection, but from his mother a human nature; he has the threefold character of prophet, priest, and king; the first office he fulfilled by his life and death on earth, and now as priest he mediates before the deity; as king he will return to earth and reign over all the world from the throne of David. In 1890 they had in the United States 63 organizations and 1,277 members.

CHRISTCHURCH, a parliamentary and municipal borough and seaport on the English channel, in Hampshire, at the head of the estuary formed by the Avon and Stour, 24 m. s.w. of Southampton. It has manufactures of fusee chains for clocks and watches, and of hosiery. It has also a salmon-fishery. The priory church, one of the most interesting and magnificent of English ecclesiastical structures, dates from the reign of William Rufus, and was restored in 1861. A battery of artillery is generally stationed in the commodious barracks. The borough comprises two favorite watering-places, Muford and Bournemouth. There are traces here of a Roman temple to Mars. Pop. of parliamentary borough, '91, 53,300. It returns one member to parliament.—C. bay has a double tide every 12 hours.

CHRISTCHURCH, capital of the province of Canterbury, in New Zealand, situated on the river Avon, about 8 m. from the sea. Its port is Littleton, with which it is connected by a railway, and it is in railway communication with the n. and s. It is the center of a great grazing district, and has also flourishing manufactories. There is a large export trade, chiefly in timber and wool. The city possesses numerous fine public buildings, churches, theater, etc. Pop. '91, 16,200, with suburbs, 31,600.

CHRIST-CHURCH, THE CATHEDRAL OF (Oxford). This great society has had three distinct foundations. In 1526, Cardinal Wolsey obtained from Clement VII. a bull for the suppression of 22 monasteries, the site of one of which he selected as the site of a new college, to be called cardinal college, and which he intended to endow on a scale of magnificence beyond that of any other foundation in Oxford. On the fall of Wolsey in 1539, the whole establishment came into the hands of King Henry VIII. In 1532, that prince refounded it under the name of King Henry VIII.'s college, and in 1546 he once more re-established the college, under the name of "Christ-church cathedral in Oxford, or the foundation of King Henry VIII., with a dean and 8 canons, 60 students, 40 school-boys, clerks, choristers," etc. This foundation is now subsisting, though it has under

gone considerable modifications. To none of the canonries were any duties assigned by King Henry VIII. From time to time, however, the canonries have been annexed to various university professorships, more particularly one to the professorship of divinity, by King James I.; one to the professorship of Hebrew, by King Charles I., and one to the professorships of ecclesiastical history and pastoral theology respectively, by Queen Victoria.

Several changes were introduced by the commissioners appointed under 17 and 18 Vict. c. 81. There is now only one sinecure-enjoying canon. When he is off the list, no one may hold a canonry save a professor, the archdeacon, or the sub-dean. The studentships are now 80 in number, and are, as before, divided into junior and senior studentships, differing considerably as to emolument. All these are now open, the old system of appointment by nomination having been abolished. About three junior students are elected every year in Lent term, one in every three for excellence in mathematics or physical science; and besides these, three are sent up yearly from Westminster. The senior studentships are also open, with the usual limitation of independent income. Of these, however, only a third can be held by laymen. The studentships were very poor; but an improvement in this respect has been included among the recent changes. Some valuable exhibitions, however, and 90 benefices, are in the gift of the society. In 1875, there were about 1150 names on the college books. No statutes were given to C., owing to the death of the king having taken place shortly after the final foundation of the college. It was, in consequence, entirely governed by the orders of the dean and chapter, to the total exclusion of the tutors. To this separation of the governing from the teaching body was due its slight repute in the schools.

CHRISTE ELEISON. See **MASS**.

CHRISTENING, a term often used as equivalent to baptism (q.v.). It is disliked by some, and of course liked by others, as favoring the doctrine of baptismal regeneration; being, indeed, according to its derivation, expressive of the notion that a person is *made a Christian* in baptism. But, like many other terms, it is frequently employed without reference to its origin, and without any intention of conveying the opinion which it might be strictly held to imply.

CHRISTIAN, a co. in central Illinois, traversed by the Illinois Central and other railroads. Pop. '90, 30,531. Co. seat, Taylorville.

CHRISTIAN, a co. in s.w. Kentucky, on the Tennessee border, intersected by the Louisville and Nashville railroad; 708 sq. m.; pop. '90, 4118, includ. colored. It is hilly in the n., but level in the s., with productive soil; the products are wheat, corn, hay, butter, wool, and tobacco. Co. seat, Hopkinsville.

CHRISTIAN, a co. in s.w. Missouri, drained by James river, and intersected by the St. Louis and San Francisco railroad; 556 sq. m.; pop. '90, 14,017, including colored. Co. seat, Ozark.

CHRISTIAN II. King of Denmark, Norway, and Sweden, b. at Vyborg, in the island of Funen, 2d July, 1481. He ascended the throne of Denmark in 1513. Shortly after his marriage in 1515, with a sister of the emperor Charles V., a young Norwegian peasant-girl, with whom C. was in love, died, or, as it was believed, was murdered. That natural ferocity, for which C. was surnamed the *Angry*, burst forth most furiously on this occasion. He caused the governor of the castle, Torben Oxe (see **DYVEKÉ**), to be beheaded. He afterwards declared open war against Sweden, took Stockholm through fraud, and had himself crowned king. But the cruel vengeance and treachery of C. after this event excited the indignation of that country, which, headed by Gustavus Vasa (q.v.), succeeded in driving out the Danes, liberating itself from the yoke of the house of Kalmar, and finally electing Gustavus Vasa (in 1523) to the throne. In Denmark, too, the aristocracy had risen, and an insurrection in Jütland following, C. found himself forced to flee for refuge to the Netherlands, and his uncle Frederick I. (q.v.), the introducer of the reformation into Denmark, elected king in his place. Encouraged, however, by the Catholic party in the Netherlands, and assisted by Charles V., C. landed successfully in Norway in 1531; but at the battle of Aggerhuus in 1532, he was totally defeated, and made prisoner in the castle at Sonderburg, from which he was liberated after 12 years of confinement. He died 25th Jan., 1559.

CHRISTIAN IV. King of Denmark and Norway, and duke of Schleswig-Holstein, b. in Zealand, 12th April, 1577, and elected successor to the throne in 1580. He assumed the scepter in 1593. From 1610 he carried on a successful war, known as the Kalmarian war, against Charles IX. of Sweden, and his successor, Gustavus Adolphus, which ended in an advantageous peace in 1613. As leader of the Protestants in the thirty years' war, C. was not successful. His labors for the improvement of his country, in which he was indefatigable, were, however, most beneficial. He strengthened its maritime power; extended its commerce as far as the East Indies, where he obtained the inland trade of the country. His legislative and financial reforms, added to his love and patronage of the arts and sciences, gained for him the esteem of his people, especially of the learned. He died in 1648.

CHRISTIAN VII., King of Denmark, son of Frederick V. and Louisa of England, b. 29th Jan., 1749. He succeeded to the throne of his father 14th Jan., 1766, and in the same year married Caroline Matilda, sister of George III. of England. The dissipations of his early life had enfeebled his energies, and his ministers, headed by count Bernstorff, assumed control. Bernstorff was supplanted by Struensee (q.v.), whose influence over the king and queen, added to his unpopularity, led the queen dowager and her son, afterward Frederick VI. (q.v.), to plot against him. Bernstorff was recalled; the incapacitated king now governed only nominally, and in 1784 Frederick ascended the throne as joint regent with his mother. C. d. Mar. 13, 1808.

CHRISTIAN VIII., 1786-1848; King of Denmark, nephew of Christian VII. When Norway was ceded to Sweden by the treaty of Kiel, the people of the former country repudiated the transfer, and C. was then made governor, raised an army and convened a diet, at which a constitution was framed, and he was elected, May 29, 1814, king of Norway under the title of Christian I., but the allied powers compelled him to relinquish the throne on the 10th of Oct.

CHRISTIAN IX., King of Denmark, was born in 1818. By the protocol of London, issued in 1852, the succession to the crown was vested in him, and he ascended the throne in 1863. In 1874, on the occasion of the 1000th anniversary of the existence of Iceland as a nation, he granted a new constitution, visiting Iceland in person at the time of its coming into operative power. He is the father of the Princess Alexandra of Wales, King George of Greece, and the dowager empress of Russia.

CHRISTIAN BROTHERS. See SCHOOLS (BROTHERS OF CHRISTIAN).

CHRISTIAN COMMISSION, THE UNITED STATES, an important organization in the northern states during the late civil war, to aid and co-operate with the sanitary commission, and generally to assist in the cause of the union. Its purpose was to supply material wants and comforts for the army, especially to the sick or wounded. It gave also an unsectarian religious help. Like the sanitary commission, it accomplished a vast amount of valuable work. The C. C. was originated by a call from the Young Men's Christian association of New York. It is noticeable as one of the earliest signs, as well as causes, of the growing charity among different denominations so marked in recent years. See *Annals of the Christian Commission*, by Moss.

CHRISTIAN CONNECTION, or more properly CHRISTIANS, an organization of Christians originating near the close of the 18th century. The first organizations were in Virginia, composed of minister and churches seceding in 1793 from the Methodists under the leadership of James O'Kelly. At first they were known as "Republican Methodists," but in 1794 in Lebanon Church, Surrey county, Va., they adopted the name "Christian" to the exclusion of all others, Rev. Rice Haggard having made the motion. In 1801, Abner W. Jones, M.D., a minister in the Baptist Church in Vermont withdrew therefrom and organized an independent church at Lyndon, Vt., which soon accepted the name Christian. At about this time there was a secession from the Presbyterians of Kentucky, largely growing out of the "Cane Ridge Revival." A separate presbytery was formed, but soon dissolved, and the churches took the name "Christian." These three organizations soon merged into one under the one name, and rapidly spread into all parts of the U. S. and Canada. In 1854 there occurred a division on the question of slavery, and the southern churches declined further affiliation with the northern ones. Within the last few years the separate churches have been drawn together by mutual interest until virtually there is now no division. The southern delegates are entitled to seats in the American Christian Convention. Their central idea is, that the church of Christ is one, and embraces all who are truly believers in him; and that the organized church should be so constituted, named, and governed as to welcome to its fellowship any who are truly Christians and "walk in newness of life." Each congregation is independent, and the Bible is the standard of faith and practice. They hold that the Scriptures are inspired and are of divine authority. They grant to every one the right of private interpretation, and hence differences of theological views do not bar church fellowship. They hold that there is one God, the Father; that Christ is a divine being, and is the mediator between God and man; that the sufferings of Christ atone for the sins of all men, who, by repentance and faith, may be saved; that immersion is the proper form of baptism (though in this the individual conscience should be respected), and believers are the only proper subjects for that ordinance; that communion at the Lord's table is open to all believers. In government and usage they are congregational.

The American Christian Convention, in which all the local conferences have representation, and through which missionary and educational interests are carried forward, meets every four years. It has a constitution, is incorporated, and has regular departments under the direction of department secretaries. The Southern churches also have a general convention, as does New England. They have institutions of learning as follows: Starkey college, at Eddytown, N. Y.; Christian Biblical Institute, Stanfordville, N. Y.; Elon college, Elon, N. C.; Union Christian, Merom, Ind.; LeGrand College, LeGrand, Mo.; Kansas Christian college, Lincoln, Kans.; Weaubleau Institute, Weaubleau, Mo.; Franklinton college (for colored people), Franklinton, N. C. and the Correspondence college, of which Rev. M. Summerbell, D.D., PH.D., is president. Antioch college was founded by the "Christians," but they have not continuously had control of it. In 1897 there were reported 1384 churches, 1372 ministers, and 120,000 communicants. The denomination is carrying forward home and foreign missionary interests with zeal and success, has a publishing house at Dayton, Ohio, and continues the publication of the *Herald of Gospel Liberty*, begun in 1808. Besides this, there are several other publications of note and merit.

CHRISTIAN ENDEAVOR, SOCIETY OF, the name adopted by a society formed in the Williston Cong. church, Portland, Me., Feb. 2, 1881, and subsequently adopted by similar organizations and by the United society. The Young People's S. of C. E., as the local body is usually termed, aims to train young people for the membership and duties of the church by means of pledged and constant work. The constitution, which is flexible according to the needs of each local church, insists primarily upon attendance on and participation in the weekly meeting for prayer. Consecration meetings, "lookout," prayer-meeting, and social committees are other factors. Other committees are optional; but the purely religious features must be paramount. Its motto is, "For Christ and the church," and its spirit undenominational. Societies exist in all evangelical denominations, in nearly every Protestant country, and in all missionary lands. The first convention was held at Portland, June 2, 1882; in Oct., 1883, the United society was formed, and subsequently was chartered under the laws of the state of Maine. The first state union formed was that of Connecticut, in 1886. In 1896 there were 47,000 societies, including 6000 societies in foreign lands, and a membership of 2,800,000. The Pres. of the United society is Rev. F. E. Clark; the official organ, the weekly newspaper, *The Golden Rule*. A similar organization, the **EPWORTH LEAGUE**, has been formed within the Methodist Episcopal Church.

CHRISTIAN ERA, sometimes called the era of the incarnation, is now almost universally employed in Christian countries, and is used by some eastern nations. Its epoch, or commencement, is the 1st of Jan. in the fourth year of the 194th olympiad, the 753d year from the foundation of Rome, and the 4,714th of the Julian period. It is usually supposed to begin with the year of the birth of Christ, but there are various opinions with regard to the year in which that event took place. The general opinion seems to be that Christ was born four years earlier than the dates now used imply. The C. E. was introduced into Italy in the 6th c., and began to be used in Gaul in the 8th c., though not generally used in England before the close of the 8th century. Before its introduction the usual practice in Latin countries was to distinguish the years by their number in the indiction. In the C. E. the years are distinguished by Arabic numerals, those before the birth of Christ being marked *b.c.* (before Christ), or *a.c.* (*ante Christum*); and those after Christ *A.D.* (*anno Domini*, in the year of our Lord). There is difficulty in determining the years before Christ, since astronomers reckon the year preceding our era as the year 0 *B.C.*, while chronologers call it 1 *B.C.* The latter seems to be correct, and by that method the leap years before Christ fall on the years 1, 5, 9, 13, etc., while those after Christ fall upon 4, 8, 12, etc. Dates of the C. E. are greatly confused by variations of time for the beginning of the year. Dionysius, who was the author of the C. E., began the first year on the 25th of Mar., or on the day of the Annunciation to the virgin Mary, 9 months before the birth of Christ. By this calculation the C. E. began 9 months and 7 days before our year 1, which began on the 1st of January. This beginning the year on the 25th of Mar. was the practice in most Italian states as late (in Pisa) as 1745. It was adopted in some papal documents, and it was employed in France about the middle of the 11th century. In some instances the year was counted from the 25th of Mar. following our epoch, which would be 2 months and 24 days after our beginning of the era. A few writers of the 6th and 7th centuries began the year on the 1st of January. In France, the practice as late as the middle of the 16th c. was to begin the year with Easter; but in 1663 Charles IX. directed that thereafter the year should commence on the 1st of January. In Germany, about the 11th c., it was usual to begin the year with Christmas, and this practice prevailed at Milan, Rome, and other Italian cities in the 13th, 14th, and 15th centuries. In England, the practice of beginning the year at Christmas was introduced in the 7th c., and traces of it are found down to the 13th century. Gervase of Canterbury mentions that most writers of his country agreed in regarding Christmas as the first day of the year, because it formed the term at which the sun finished and recommenced his annual course. This is a remnant of the old Norse religion. In the severely cold regions of Scandinavia the return of the sun from its extreme southern declination was hailed with great rejoicing; the great yule festival was held, and offerings and thanksgiving marked the period. This was, of course, at the winter solstice, in early ages very nearly on the day of Christmas. When Anschar and other Roman Catholic missionaries penetrated to Denmark, they engrafted upon the heathen yule the Christian Christmas, and for the return of the material sun they taught the rising of the son of God. Thus, the church Christmas may be the successor not only of the Roman saturnalia, but of the Odinic yule. The memory of the latter is still strong among the rural population of England. In England, in the 12th c., the practice prevailed of beginning the year on the Annunciation, the 25th of Mar., and that was the general practice until the reformation of the calendar, in 1751, by a parliamentary law, which directed that the year 1752 should be reckoned from the 1st of Jan., thus leaving 1751 nearly three months short. English authors, however, have endeavored to make the beginning of the historical year on the 1st of January. The liturgic year of the church of England began with the first Sunday in Advent, the Lord's day before Christmas. These variations in the commencement of the year lead to much confusion in dates. The English revolution is popularly called the revolution of 1688; but if we reckon

from the 1st of Jan., it began in 1689. In the tables of modern works on chronology, the birth of Christ is placed in the year 4 before Christ. Some recent chronologers of eminence place the Nativity nearer the Christian era. Eusebius dates the crucifixion in the year 33 A.D.; but Augustine, Origen, and others, place it in the year 29 A.D. In either case, the long-established date of the commencement of the C. E. is not altered. See CHRONOLOGY.

CHRISTIANIA, a province in s. Norway; about 10,000 sq. m.: population 500,000. It is a rough, mountainous region containing many lakes, and is traversed by the Glommer, the Drammen, and other rivers. The mineral products are copper, silver, and iron. Agriculture is scarcely profitable, though cattle and horses are raised in large numbers. The chief article of export is lumber.

CHRISTIANIA, capital of Norway, is situated in the province of Aggerhuus, in a beautiful open valley on the northern side of the Christiana fiord. Pop. '91, 151,239. C. is the seat of the Norwegian government, the superior courts, and the *storting*. Besides the suburbs of Pipervigen, Hammarsborg, Vaterland, and Groenland, the town consists of C. properly so called (which was laid out by Christian IV. in 1614, in the form of a regular parallelogram of 1000 paces in length and breadth); the Old Town or Opslo, where the bishop resides; and the citadel Aggerhuus, from which the broad straight streets of the town can be fired upon. The most important public buildings are the royal palace, the bank and exchange, the house of representatives or *storting*, the governor's palace and the cathedral. To these may be added the university, the only one in Norway, which was opened in 1813, and possesses a large staff of professors. In the year 1895 it was attended by 1142 students. This institution contains, besides various scientific collections, an extensive library, a botanical garden, and an observatory (in 59° 54' 42" n. lat., and 10° 50' e. long.). The latter was opened in 1833. C. has also some good schools and learned societies, of which the "society for northern antiquities" is famous. Among the manufactures of C. are woolen fabrics, matches, tobacco, hardware, paper, wood-pulp, etc. There are also numerous distilleries and breweries. It exports in considerable quantities timber, matches, wood-pulp, horse-shoe nails, condensed milk, margarine, etc. In 1894, 2339 vessels of 878,706 tons entered the port (which, however, is covered with ice for four months). It has a regular steamboat communication with Gottenburg, Copenhagen, Kiel, Hull, and Leith. C., by means of its bay, is connected with Drammen, famous for its extensive trade in timber, etc. The scenery of the whole bay is unsurpassed in beauty.

CHRISTIANITY. It is proposed in the present article to give a very brief outline of the system of the Christian religion, and of the evidences by which its truth is established. The principal parts, both of the system and evidences of C., will be found noticed under separate heads.

C. comes to us with a claim to be received as of divine origin. It is no product of the human mind, but has for its author the Being whom it sets before us as the object of worship. It is consequently altogether exclusive; it claims to be deemed the only true religion—"the truth"—and admits of no compromise or alliance with any other system.

C. cannot be viewed as distinct from the religion of the Jews and of the patriarchs; it is the same religion accommodated to new circumstances; there has been a change of *dispensation* only. In studying either the system or the evidences of C., we are compelled continually to revert from the New Testament to the Old, and must in some measure trace the history of the true or revealed religion through the previous and preparatory dispensations.

The whole system of C. may be regarded as having its foundation in the doctrine of the existence of one God. See GOD. Next to this may be placed the doctrine of the fall (q.v.) of man. Man is represented as involved in misery by sin (q.v.)—*original and actual*—and every individual of the human race as incapacitated for the service and fellowship of God, obnoxious to the displeasure of God, and liable to punishment in a future and eternal state of being. See HELL; PURGATORY. And here we may regard the doctrine of the atonement (q.v.) as next claiming our attention—a doctrine taught in all the sacrifices (see SACRIFICE) of the patriarchal and Jewish dispensations, as well as by the words of inspired teachers. Man being utterly incapable of effecting his own deliverance from sin and misery, God sent his Son to save sinners, to deliver them from hell, to make them holy, and partakers of the eternal joy and glory of heaven.

By those who regard Christ as a mere creature, *atonement or reconciliation* with God is made to depend on the repentance of man as its immediate cause; whilst the life and death of Christ are represented as merely an example to us of obedience, virtue, and piety in the most trying circumstances; the doctrines of a propitiatory sacrifice, a substitutionary obedience, and an imputed righteousness, with all that form part of the same system, falling completely and even necessarily to the ground. These doctrines, however, are all consistently maintained in connection with the doctrine of the Trinity and the generally received doctrine as to the person of Christ. See CHRIST and TRINITY. The very incarnation (q.v.) of the Son of God is regarded as a glorious display of the divine condescension, and a wonderful exaltation of human nature; whilst a personal enjoyment of the highest dignity and bliss of which humanity is capable in the favor and fellowship of God for ever, is to be attained by faith in Jesus Christ. See FAITH and JUSTIFICATION.

The indissoluble connection between faith and salvation arises from the divine appointment, but secures a moral harmony, as it provides for bringing into operation—in accordance with the intellectual and moral nature of man—of most powerful and excellent motives for all that is morally good, the partakers of salvation being thus fitted for the fellowship of him into whose favor they are received; and as it prevents the possibility of any of them taking to themselves, or giving to others, the glory of that salvation which they really owe to Christ, and which they must therefore ascribe to Christ, as God is a God of truth, and truth must reign in the kingdom of heaven.

Salvation is ascribed by all Christians to the grace of God. The mission of Christ was an act of supreme grace; and all must be ascribed to grace for which we are indebted to Christ. The doctrine of grace, however, is part of the system of C. on which important differences subsist, especially as to the relation of the grace of God to individual men. Such are the differences concerning election (q.v.), and concerning the origin of faith, and man's ability or inability to believe of himself. But by Christians generally, the personal relation of the believer to Christ, and his faith in Christ, are ascribed to the Holy Ghost or Spirit of God, the third person of the Godhead, and so to the grace of God. See ARMINIUS, CALVINISM, and PELAGIUS.

In the view of all who hold the doctrine of the Trinity, the doctrines concerning the Spirit of God form a very important part of the Christian system. To the agency of this person of the Godhead, besides all that is ascribed to Him concerning the human nature of Christ, we are indebted for all that is spiritually good in man; He, in the economy of grace, being sent by God, on the intercession of Christ, to communicate the blessings purchased by Christ in his obedience and death. See HOLY GHOST.

Salvation begins on earth; and whenever a man believes in Christ, he is a partaker of it—is in a state of salvation. It forms an essential part of the Calvinistic system, that he who is in a state of salvation always remains so, and that the salvation begun on earth is in every case made perfect in heaven. See PERSEVERANCE OF SAINTS. Thus salvation is viewed as beginning in regeneration (q.v.), and as carried on in sanctification (q.v.), and all its joys as connected with the progress of sanctification. Faith in Jesus Christ cannot be unaccompanied with repentance, and repentance is always renewed when the exercise of faith is renewed. For although all believers are *saints* or *holy*, as set apart to God, and in contrast to what they previously were, yet there is none in this life free from temptation and sin; the successful tempter of our first parents, who assailed our Savior with temptation and was defeated, being still the active enemy of man, against whom believers in Jesus Christ are called to contend, to watch, and to pray. See DEVIL. The sense of responsibility belongs to human nature; and the doctrine of a judgment (q.v.) to come may be considered as to a certain extent a doctrine of natural religion, as may also that of the immortality (q.v.) of the soul; but the clear and distinct enunciation of these doctrines belongs to the Christian revelation, to which belongs entirely the doctrine of the resurrection (q.v.) of the dead.

Of the moral part of C., which has already been referred to, it may be sufficient here to state, that it is as harmonious with the doctrinal as it is inseparable from it; that it is founded upon the attributes of God, and is perfectly illustrated in the character of Jesus Christ; and that it is divisible into two great parts—one, of the *love of God*, and the other, of the *love of man*, or of ourselves and our neighbors. See LAW, MORAL.

The *means of grace*, or of the attainment or the blessings of salvation, form an important part of the Christian system. Of these the WORD OF GOD—or divine revelation contained in the Bible (q.v.)—first claims attention as the means of *conversion* to Christ, and of *edification* in Christ, the instrument by which salvation is both begun and carried on in men. The ordinances of God's worship are among the means of grace. Thus prayer (q.v.) is one of the chief means of grace. The sacraments (q.v.) are means of grace, concerning the precise use of which, and their relative importance as compared with the other means, considerable difference of opinion prevails among Christians. The same remark applies also to the combination of Christians into an organized body or community, the church (q.v.) with its own laws or system of church government (q.v.) and church discipline (q.v.).

We have endeavored to sketch the outline of the system of C., as much as possible according to the general belief of Christians, merely indicating the points on which the chief differences of opinion exist. Some of the principal controversies will be found noticed under separate heads.

The truth of C. is established by many different *evidences*, distinct and independent, but mutually corroborative. It appeals to reason, and demands to have its claims examined and admitted. Nor is there any *faith* where there is not a mental conviction arrived at by a process of sound reasoning.

The evidences of C. are very generally divided into two great classes, *internal* and *external*—the former consisting of those which are found in the nature of the Christian system itself, and in its adaptation to the nature and wants of man; the latter, of those which are derived from other sources. The boundary between the two classes, however, is by no means so distinct in reality as it appears in the definition of the terms. Of the multitude of books which have been written on the subject of the evidences of C., some are devoted mainly to one of these classes, and some to the other; whilst some are occupied with the development of particular evidences or arguments, and some with

the refutation of objections, and in particular of what may be called a preliminary objection—that a divine revelation can never be established by sufficient evidence at all. See REVELATION.

The evidence of miracles (q.v.) and the evidence of prophecy (q.v.), two of the principal branches of the external evidences of C., will be found noticed in separate articles. Another argument, which has been much elaborated—for example, in Paley's *Evidences*—is derived from the character and sufferings of the apostles and other first preachers of C.; their high moral worth, considered along with their great earnestness and devotedness; the absence of all possibility of selfish or base motives; and at the same time, their perfect opportunity of knowing the truth or the facts which they proclaimed. A subsidiary argument is found in the admission of the great facts regarding Jesus of Nazareth, by the early opponents of Christianity. A most important and valuable argument is found in the perfect coherence of all the parts of the Christian system, and in the agreement, as to the religion which they teach, of all the books of Scripture, notwithstanding the widely different dates of their composition, and their very different nature in other respects. See BIBLE. The relation of the Jewish ceremonies to the doctrines of C. supplies another argument of this kind, capable of being developed in a multitude of particulars. The minor coincidences between the different books of Scripture have been pointed out with happy effect in the *Horæ Paulinæ* of Paley, and in other works. The character of our Savior supplies an argument of great power: the impossibility of the invention of such a character, and of the history in which it is exhibited, by any effort of human genius, is also urged as corroborative; and the inconsistency of the morality displayed, with the supposition of imposture, has been dwelt upon with the same view. The excellency, both of the doctrinal and moral part of the system of C., its elevating and purifying tendency, the agreement of its doctrine with the facts of man's sinfulness and misery, and the suitable provision which it makes for his most deeply felt wants, are principal branches of the internal evidence of its truth. The effects of C., where it has prevailed, supply a confirmatory argument in its favor, which has formed the subject of works of great learning and interest. See EVIDENCES OF CHRISTIANITY.

CHRISTIAN KNOWLEDGE, SOCIETY FOR PROMOTING, one of the great religious associations connected with the Church of England, and the oldest of them all. It was founded in 1698, although it did not receive its present name till 1701; and had for its object: "1. To promote and encourage the erecting of charity schools in all parts of England and Wales. 2. To disperse, both at home and abroad, Bibles and tracts of religion; and, in general, to advance the honor of God, and the good of mankind, by promoting Christian knowledge, both at home and in other parts of the world, by the best methods that should offer." These objects it has never ceased to pursue, chiefly directing its efforts to the British dominions; partaking at once of the nature of an educational association, a missionary society, a Bible society, and a religious tract society; and notwithstanding the operations of other great societies in these several departments of Christian benevolence, its revenue amounts to about £100,000 a year. The Protestant missionaries who labored in the s. of India in last century, were supported chiefly by this society, which has also contributed largely of its funds for the establishment of Christian schools in that country.

CHRISTIAN NAME. See NAME.

CHRISTIANSAND', the principal t. of the province or *stift* of that name in Norway, is situated at the mouth of the Torridalselvi, in the bay of Christiansand. Pop. '91, 12,541. C. is the residence of a bishop and high-bailiff or *stift-amtmand*, and possesses a branch of the Norwegian bank, a gymnasium, and several charitable foundations. The manufactures are leather, tobacco, cotton, etc. Ship-building forms also a considerable branch of its industry. The town, which was built in 1641 by Christian IV., has an excellent harbor, divided into two parts by the island of Oddern, upon which are situated the quarantine hospital and custom house. C. exports wood, lobsters, and salmon in large quantities. The town and harbor are protected by several fortifications. To the west of C. lies the harbor of Ny-Hollesund.

CHRISTIANSBURG, a town and co. seat of Montgomery co., Va.; in a magisterial district of the same name; 86 miles w. of Lynchburg; on the Norfolk and Western railroad. The district includes a part of the Blue Ridge. The town contains a female institute, tobacco factory, and weekly newspaper. Pop. '90, town and district, 5215.

CHRISTIANSFELD, a settlement of Moravian brothers, in the northern part of Schleswig, was founded in 1772. The houses, which are well built, and cheerful in appearance, are arranged in two parallel streets, with the church upon a green plot in the middle. Population about 2000.

CHRISTIANS OF ST. JOHN, or NAZAREANS, a sect in Persia, in the country around Bassorah. They seemingly deify John the Baptist and consider Jesus an impostor. They say that they dwell on the Jordan in the time of Jesus, but were driven from Palestine by the Mohammedans. Their name "Christians" is wholly a misnomer. They consider the Jehovah of the Jews a spurious divinity, and Christ a false teacher; that the world was created by seven angels of darkness who inhabit the seven planets, and there is also a kingdom of light superintended by good angels. Behind these kingdoms is a region of splendor, and there is the supreme original being, Ferha, and the

female principle, Ajar. There are conflicts between the worlds of darkness and of light, but light is to triumph. The Mosaic and Christian systems of religion came from the region of darkness; but that of John the Baptist from the region of light. Baptism is the means of introducing men to the kingdom of light. John was married, but his children sprang from the Jordan. These people practice polygamy, and forbid mourning for the dead. They have five sacred books, of which four are doctrinal, and one treats of astrology. It is supposed that, 200 years ago, they numbered about 100,000.

CHRISTIANS OF ST. THOMAS, the name of a branch of an old Persian church still existing on the Malabar coast, formed originally by excommunicated Nestorians. Their liturgy is in the Syriac language. They still celebrate the early agape or love-feast, use bread, salt, and oil in the communion of the supper, and anoint infants in baptism. Their priests are allowed to marry.

CHRISTIAN SCIENCE. See **SCIENCE, CHRISTIAN.**

CHRISTIANSTAD, the strongly fortified capital of a province of the same name in the s. of Sweden. It is situated on the Helge, about 9 m. from the Baltic, and 265 s.w. of Stockholm. C. is the residence of a governor, and the seat of a court of justice. It is a beautifully built town, and possesses an arsenal, a school, a magnificent church, and a senate-house. Pop. 9,203, employed chiefly in the manufacture of woollen goods, leather, gloves, etc. There is also some trade in wood, pitch, potash, etc. The town, which was founded by Christian IV., has suffered many sieges during the wars between Denmark and Sweden. The province of Christianstad has an area of 2,486 m.; pop. '95, 219,858.

CHRISTIANSTED, the chief t. of the Danish island of St. Croix, in the West Indies. It stands on the n.e. coast of the island, and has an excellent harbor, which is defended by a fort and a battery. Here resides the governor-general of the Danish West Indies. The number of its inhabitants is 10,000.

CHRISTIANSUND, a seaport on the w. coast of Norway, 85 m. w.s.w. of Trondhjem, in 63° 3' n., and 7° 40' e.; pop. '91, 10,381. The chief export is fish.

CHRISTIAN UNION CHURCHES, an organization projected at Columbus, Ohio, in 1865, and having, in 1887, 15,000 churches, 500 ministers, and 120,000 members, principally in the western states. Their leading doctrines, as stated in their publications, are: the oneness of the church, with Christ the only head and the Bible the only rule of faith and practice; the good works of a Christian life the only condition of fellowship; the suppression of controversy; local or congregational church government; no preaching of party politics. Baptism is a condition of membership, but in communion they are practically unrestricted. In 1887 steps were taken toward a union with the Christian connection (q.v.). A similar body in the south is called the Christian Church, and had, 1890, 143 churches, about 130 ministers, and 13,000 communicants.

CHRISTINA, Queen of Spain. See **MARIA CHRISTINA.**

CHRISTINA, Queen of Sweden, only child of the great Gustavus Adolphus, was b. Dec., 1626, and succeeded her father in 1632, when only six years old. Distinguished equally by beauty and the possession of a lively imagination, a good memory, and uncommon intelligence, she received the education rather of a man than of a woman; and to this may in part be attributed the many eccentricities of her life. During her minority, the kingdom was governed by the five highest officers of the state, the principal being chancellor Oxenstiern. In 1644, she assumed the reins of power, and, in 1650, was crowned with the title of *king*. She had previously declared her cousin, Charles Gustavus, her successor. For four years thereafter, she ruled the kingdom with vigor, and was remarkable for her patronage of learned and scientific men. In 1654, however, at the age of 28, weary of the personal restraint which royalty imposed on her, she abdicated in favor of her cousin, reserving to herself sufficient revenues, entire independence, and supreme authority over her suite and household. Leaving Sweden, she proceeded to Brussels, where she embraced the Roman Catholic religion. She afterwards went to Rome, which she entered on horseback, in the costume of an amazon, with great pomp. Confirmed by Pope Alexander VII., she adopted the surname of Alessandra. In 1656, she visited Paris; and the following year, on a second residence there, she caused her grand equerry, Monaldeschi, who had enjoyed her entire confidence, to be executed in her own household for treason. In 1658, she returned to Rome, and, in 1660, the death of the king, her cousin, caused her to hasten to Sweden; but, failing in her attempt to be reinstated on the throne, she again left the country. In 1666, she aspired to the crown of Poland, but was unnoticed by the Poles. The remainder of her life was spent in Rome in artistic and scientific pursuits. Besides founding an academy, she collected valuable MSS., medals, and paintings, and died April 19, 1689. Much of her conduct favors the idea that at times she was scarcely sane.

CHRISTINOS, a political party in Spain during the regency of Queen Christina, who were opposed to the Carlists.

CHRISTISON, Sir ROBERT, D.C.L., an eminent physician, son of Alexander Christison, professor of humanity in the university of Edinburgh, was b. at Edinburgh, July

18, 1797; was educated at the high school of his native place, and, in 1811, became a student at the university there. After graduating in 1819, he proceeded to London and Paris; and, in the French capital, studied toxicology under the celebrated Orfila, a department of medical science in which in Britain his name has become eminent. Commencing the practice of medicine at Edinburgh, he was, in 1822, appointed professor of medical jurisprudence in the university of that city, and, in 1832, was promoted to the chair of *materia medica*. Besides contributing papers on various subjects to medical journals, C. is author of a *Treatise on Poisons*, published in 1829, recognized as a standard work on the subject; *Biographical Sketch of Edward Turner, M.D.*, 1837, being an address delivered before the Harveian society of Edinburgh; a treatise *On Granular Degeneration of the Kidneys*, 1839; and *The Dispensatory, a Commentary on the Pharmacopœias of Great Britain*, 1842. Twice president of the royal college of physicians, Edinburgh, and ordinary physician to the queen in Scotland, in 1871 he was created a baronet. In 1877, sir Robert retired from all work. He d. 1882.

CHRISTLIEB, THEODOR, D.D., b. 1833; a native of Wurtemberg; educated at Tubingen, a teacher in France, a preacher in London, and an author of lectures on *Modern Doubt and Christian Belief*. He returned to Germany in 1865, and was made professor of theology at Bonn. In 1873, he was a delegate to the evangelical alliance, in New York. At its sessions his addresses excited great interest. He d. in 1889.

CHRISTMAS, the day on which the nativity of the Savior is observed. The institution of this festival is attributed by the spurious Decretals to Telephorus, who flourished in the reign of Antoninus Pius (138-61 A.D.), but the first certain traces of it are found about the time of the emperor Commodus (180-92 A.D.). In the reign of Diocletian (284-305 A.D.), while that ruler was keeping court at Nicomedia, he learned that a multitude of Christians were assembled in the city to celebrate the birthday of Jesus, and having ordered the church doors to be closed, he set fire to the building, and all the worshippers perished in the flames. It does not appear, however, that there was any uniformity in the period of observing the nativity among the early churches; some held the festival in the month of May or April, others in Jan. It is, nevertheless, almost certain that the 25th of Dec. *cannot* be the nativity of the Savior, for it is then the height of the rainy season in Judea, and shepherds could hardly be watching their flocks by night in the plains.

C. not only became the parent of many later festivals, such as those of the Virgin, but especially from the 5th to the 8th c., gathered round it, as it were, several other festivals, partly old and partly new, so that what may be termed a *Christmas cycle* sprang up, which surpassed all other groups of Christian holidays in the manifold richness of its festal usages, and furthered, more than any other, the completion of the orderly and systematic distribution of church festivals over the whole year. Not casually or arbitrarily was the festival of the nativity celebrated on the 25th of Dec. Among the causes that co-operated in fixing this period as the proper one, perhaps the most powerful was, that almost all the heathen nations regarded the winter-solstice as a most important point of the year, as the beginning of the renewed life and activity of the powers of nature, and of the gods, who were originally merely the symbolical personifications of these. In more northerly countries, this fact must have made itself peculiarly palpable—hence the Celts and Germans, from the oldest times, celebrated the season with the greatest festivities. At the winter-solstice, the Germans held their great yule-feast (see **YULE**), in commemoration of the return of the fiery sun-wheel; and believed that, during the twelve nights reaching from the 25th Dec. to the 6th Jan., they could trace the personal movements and interferences on earth of their great deities, Odin, Berchta, etc. Many of the beliefs and usages of the old Germans, and also of the Romans, relating to this matter, passed over from heathenism to Christianity, and have partly survived to the present day. But the church also sought to combat and banish—and it was to a large extent successful—the deep-rooted heathen feeling, by adding—for the purification of the heathen customs and feasts which it retained—its grandly devised liturgy, besides dramatic representations of the birth of Christ and the first events of his life. Hence sprang the so-called “manger-songs,” and a multitude of C. carols, as well as C. dramas, which, at certain times and places, degenerated into farces or fools’ feasts (q.v.). Hence also originated, at a later period, the Christ-trees, or Christmas-trees, adorned with lights and gifts, the custom of reciprocal presents, and of special C. meats and dishes, such as C. rolls, cakes, currant-loaves, dumplings, etc. Thus, C. became a universal social festival for young and old, high and low, as no other Christian festival could have become.

In the Roman Catholic church, three masses are performed at C.—one at midnight, one at daybreak, and one in the morning. The day is also celebrated by the Anglo-Catholic church—special psalms are sung, a special preface is made in the communion service, and the Athanasian creed is said or sung. The Lutheran church, on the continent, likewise observes C.; but the Presbyterian churches in Scotland, and the whole of the English dissenters, reject it, in its religious aspect, as a “human invention,” and as “savoring of papistical will-worship,” although, in England, dissenters as well as churchmen keep it as a social holiday, on which there is a complete cessation from all business. But within the last hundred years, the festivities once appropriate to C. have

much fallen off. These at one time lasted with more or less brilliancy till Candlemas, and with great spirit till twelfth-day.

CHRISTMAS-BOX, a small money-gift to persons in an inferior condition on the day after Christmas, which is hence popularly called *boxing-day*. The term, and also the custom, are essentially English, though the making of presents at this season and at the new year is of great antiquity. A number of interesting particulars concerning the Christmas-box will be found in Brand's *Popular Antiquities*. Here, we need refer only to the usage in its later aspect. Within the memory of middle-aged persons, the practice of giving Christmas-boxes, or petty presents, to apprentices, domestic servants, and tradesmen, had become a serious social nuisance, more particularly in London, where every old custom seems to linger, and is most difficult to be got rid of. Householders felt under an obligation to give money to the apprentices in the shops where they dealt, also to various inferior parish officers, including scavengers and lamplighters: while shopkeepers, on the other hand, were equally impelled to make presents to the male and female servants of their customers. The grievance finally became so intolerable that the public authorities were forced to remonstrate.

CHRISTMAS CARDS, as now sold and distributed in millions during the festive season, in their various forms, are familiar to every one. The invention has been ascribed by some to the late Sir Henry Cole; by others, the credit of designing the first Christmas card in 1846, is given to J. C. Horsley, R.A. Immense progress has been made in beauty and artistic effect since the time when the popular emblems were more or less confined to Old Father Christmas, images of flowers, the robin-redbreast, or the dove. The prize competitions for designs have also done not a little in stimulating the art. Their production is begun often more than a year in advance; and the system of sending Christmas cards, as also New Years', Easter, and birthday cards, has created a new trade, and a new field for artists, engravers, lithographers, and printers. The quantity of Christmas cards passing through the post-office leads to congestion for a few days in ordinary deliveries. The greatest variety of design is seen in the cards of Prang, Boston, who first introduced chromo-lithography. Of late years, Easter cards are as much sent as those appropriate to Christmas.

CHRISTMAS CAROLS. The word *carol* (Ital. *carola*, and Fr. *carole*, a round dance—probably from Lat. *corolla*; Welch, *coroli*, to reel, to dance; the name is thence applied to the music or song accompanying such a dance: *carillon* is probably allied) signifies a song of joy. The practice of singing carols, or, at all events, sacred music, in celebration of the nativity of Christ as early as the 2d c., is considered as proved by the circumstance that a large sarcophagus belonging to that period has sculptured upon it a representation of a Christian family joining in choral praise for this purpose. A century or two after this, however, the C. C. seem to have sadly degenerated, and become, in fact, so indecent, that the clergy found it necessary to forbid them. Under the Anglo-Saxon kings, merriment and piety were pleasantly combined in English life, a peculiarity that affected the C. C. of that period not a little; but by the 13th c. the jocosity had unhappily lapsed into what would now be considered profanity. The oldest printed collection of English C. C. bears the date of 1521. The majority of these, though written by men of learning—priests and teachers—exhibit a lamentable ignorance of the character of the two most prominent persons in the carols—Mary and Jesus. In 1525 was kept the “still Christmas,” on account of the illness of King Henry; but with this exception, the sacred season appears to have been regularly celebrated with joyous music and songs during the Tudor period. In 1562, C. C. of a more solemn nature were introduced. By the Puritan parliament, Christmas was abolished altogether, and holly and ivy were made seditious badges; and in 1630 the Psalms, arranged as carols, were advertised. After the restoration, the C. C. again exhibited a hearty, cheerful, and even a jovial character. Those with which the dawn of Christmas is now announced in England are generally religious, though not universally so. In France, the carols at this season used to be much less sacred than gay. Often, indeed, they were grossly Bacchanalian.

CHRISTMAS ISLAND, an island in the Pacific ocean (latitude 1° 57' 16.8" N.; longitude, 157° 26' 49.5" W.), is a large, low atoll, with a good anchorage, and is the headquarters of an American guano company.

CHRISTOL'OGY is the doctrine of the person of Christ. The word itself is to be found, once or so, in the divines of the 17th c. (See Dean Trench on the *Study of Words*), but the department of scientific theology which it now represents is almost entirely the growth of modern, and particularly of German inquiry. As yet, it can hardly be said that the word C. is accredited in Great Britain, but the same differences of opinion which led to its adoption in Germany, are beginning to manifest themselves here also. There are only three methods of apprehending the doctrine of the person of Christ. First, there is the *rationalistic* method. This consists in representing the development of the Messianic idea in Jewish history as purely natural, and conditioned by purely human and historical influences—in short, as a subjective or self-originated notion, to which there was no correspondent divine reality. Second, there is, what, for want of a better word, we may call the *spiritualistic* method (that of theologians like Neander, Rothe, etc.). This consists in representing the development of the Messianic idea in Jewish

history as both natural and supernatural; that is to say, it asserts the existence of a divine objective reality ("the eternal Son of God") as the basis of the subjective idea in the minds of the Jews, and regards the growth of that idea, and the influence of historical circumstances, as the result of a supernatural providence, which culminated in the revelation "of the mystery of godliness, God manifest in the flesh." Third, there is the *dogmatic* method, which is the one accepted by the common order of theologians. This consists in representing the doctrine of the person of Christ as *symbolically* known to the spiritually-minded among God's people from the earliest ages. "Abraham saw his (Christ's) day afar off." This is interpreted to signify that, by the grace of prophetic illumination, the righteous men of old were enabled to foresee in a mysterious and inexplicable manner the atonement of Christ, as it happened in history. Admitting with the spiritualistic theologians, that the Messianic idea among the Jews underwent, in some sense, a historical development, the dogmatic Christologists differ, in general, from the former by attributing to the higher minds such a knowledge of the *work* of Christ, as logically involves a knowledge of his person and character. The entire absence, however, of any *personal* traits of Christ in the Old Testament, such as might be expected of those who had seen him even with the eye of faith, has induced many orthodox theologians to shrink from making any statement in regard to what may have been the doctrine of the person of Christ among the ancient Jews.

CHRISTOPHE, HENRI, king of Hayti, b. Oct. 6, 1767, was at one period a slave and tavern-cook in Cape Town, St. Domingo, and afterwards overseer of a plantation. In 1790, he joined the black insurgents against the French, and, from his gigantic stature, energy, and courage, soon became a leader among them. By Toussaint Louverture, he was appointed brig.-gen., and employed to suppress an insurrection headed by Moyse or Moses, his nephew. C. captured the latter, and on his execution, succeeded him as governor of the northern province of French St. Domingo. In 1802, he gallantly defended Cape Town when Gen. Leclerc arrived there with a French army destined for the reduction of the blacks, and effected his retreat with 3,000 men, after having burned the greater part of the town. The perfidious seizure of Toussaint he amply revenged, and during the short-lived government of Dessalines, who was slain by a military conspiracy in Oct., 1806, C. was gen.-in-chief of the Haytian army. In Feb., 1807, he was appointed president of Hayti for life. A republic being, about the same time, organized at Port-au-Prince, with Petion at its head, civil war commenced between them. On Mar. 28, 1811, C. was proclaimed *king* of Hayti, by the name of Henri I., and solemnly crowned, June 2, 1812. In 1814, he and Petion suspended hostilities, and by his power and skill, C. was enabled to counteract the attempts made by France to regain its authority in the island. His avarice and cruelty led to an insurrection, which was aided by Gen. Boyer, who had succeeded Petion in 1818; and the rebellion having spread to Cape Town, C.'s deposition was proclaimed, at the head of the troops, by the duke of Marmalade, one of the first dignitaries in the kingdom. Deserted by his body-guard and all his nobles, he shot himself, Oct. 8, 1820. He left a code of laws, which he called the "Code Henri," in imitation of the Code Napoleon.

CHRISTOPHER, HERB. See ACTÆA.

CHRISTOPHER NORTH. See WILSON, JOHN.

CHRISTOPHER, SAINT, a saint of the Roman Catholic and Greek churches. He is supposed to have suffered martyrdom about the middle of the 3d century. According to vulgar legend, C., whose name was originally *Adokimos* (the unrighteous), was a native of Palestine, Syria, or Lycia, and a person of prodigious bulk and strength. His height was 12 feet. So proud was he of his gigantic frame, that he would serve only the mightiest princes. Having attached himself to one, who went for the greatest of his day, C. stayed with him for a short time, but soon discovered that his master was terribly afraid of the devil, in consequence of which, C., with fearless consistency, passed into the service of the latter. One day, however, when the devil and he chanced to be walking through a wood, they came across an image of Christ. His new master exhibited such perturbation and alarm at the sight, that C. entirely lost confidence in him, and resolved to find out the Savior, and follow him. For a long while he searched in vain, but finally he fell in with a hermit, who showed him Christ, and baptized him. C. despised the customary penances, and in consequence, it was imposed on him to carry Christian pilgrims on his shoulders over a stream which had no bridge. One day, a little child came to the stream; C. took it on his shoulders, but soon began to sink under the weight of his burden. The child was Christ himself, and to prove it, he commanded C. to stick his staff into the ground. He did so, and next morning it had blossomed into a palm-tree bearing fruit. This miracle converted thousands to Christianity. C.'s success excited the enmity of Dagnus, the prefect of that region, who put him in prison, scourged him with red-hot rods, put a burning helmet on his head, and clapped him on a burning stool. C. still remained uninjured. Multitudes of poisoned arrows were now discharged against him, but they rebounded from his charmed body, and one even wounded the prefect himself in the eye. C. pitied his tormentor, and freely offered his head to the executioner, that the prefect might be healed by the blood which should flow from it. This was done, and, as a matter of course, Dagnus and his family became Christians. The Greek church celebrates his festival on the 9th of May; the Roman Catholics, on the 25th of July.

St. C. was greatly invoked in times of pestilence, or when people were digging for treasures, to frighten away the spirits who watched over them. The formula used was called a *Christopher's prayer*. He was also the patron of an order of moderation, founded in Austria in 1517, for the purpose of checking excessive drinking and swearing, and which was called the order of St. Christopher.

CHRISTOPHER'S, ST., or, popularly, *St. Kitts*, an island near the n.e. bend of the great arch of the Antilles, 46 m. to the w. of Antigua, and 2 m. to the n. of Nevis. With a very unequal breadth, it is 20 m. long from s.e. to n.w., containing about 44,000 acres, and (1881) 29,137 inhabitants. It belongs to Great Britain, and has a legislature of its own, with an executive immediately subordinate to the governor-in-chief of the Leeward group, residing in Antigua. In 1880, the revenue of the colony was £32,000, having been only £3,638 in 1834; so that, under the system of free labor, it had increased nearly nine-fold in 46 years. During the same interval, the imports had risen in value from £63,018 to £168,000, and the exports from £105,267 to £186,000. The staple exports are sugar, rum, and molasses. The debt of the island in the year 1880 amounted to £3700. Education is in a promising condition. At the present time (1891), the establishment of grammar schools is contemplated. In 1886 the population was 45,000.

The chief towns, both of them seaports with open roadsteads, are Basse-Terre, defended by Fort Smith, and Sandy Point, protected by Fort Charles and Brimstone Hill. Of Fort Smith, the exact lat. and long. are 17° 17' 7" n., and 62° 48' west. The mean annual temperature of these places, and of the coast generally, is about 80° F.; but the mornings and evenings, even of the hottest days, are agreeably cool. The length of the island is traversed by a well-wooded ridge of volcanic origin, which has in its center a crater; and towards the w. extremity of the range, rises the nearly perpendicular crag of Mt. Misery, with an altitude of 3,711 ft. above the level of the sea. Over the adjacent slopes, which gradually descend to the water's edge, this central range sends down several streams—almost every plantation, in fact, receiving its rivulet in the rainy season. The springs, though numerous, are yet mostly brackish; and indeed the southern extremity of the island presents a number of salt ponds.

St. Kitts, appropriately named by the natives "the fertile isle," was discovered by Columbus in 1493, and colonized by the English in 1623, who were almost immediately joined by some French adventurers. After treacherously exterminating the Caribs, the French and English, often quarreling, occupied the island, till, in 1713, the treaty of Utrecht gave the whole to England. In 1782, during the war of American independence, St. Kitts was captured by the French, but restored. On July 31, 1865, a terrific fire took place at Basse-Terre.

CHRISTOPULUS, ATMANASIOS, 1772–1847; a Greek poet, the son of a Wallachian priest. He studied at Buda and Padua, and became teacher in the family of the Wallachian prince Mourousi, and, after the fall of that prince, he assisted the hospodar Caradja in drawing up a code of laws for the nation. He wrote love ditties and drinking songs, which are very popular among the Greeks. He is also the author of a tragedy, and some philological works.

CHRIST'S COLLEGE, Cambridge, was originally founded by Henry VI., under the name of God's house, and was intended by him to consist of a master, 12 fellows, and 47 scholars. In 1505, however, there were only three fellows besides the master, when lady Margaret, countess of Richmond and Derby, mother of Henry VII., "counting herself, as of the Lancaster line, heir to all Henry VI.'s godly intentions," made up the full number, and endowed the college liberally, changing its name to Christ's college. Edward VI. added one fellow, and three scholars; and sir John Finch and sir Thomas Baines increased the number of fellows to fifteen. C. C. possesses many rich benefactions for the encouragement of students, amongst which are specially to be noticed four studentships founded by Christopher Tancred, worth £107 per annum, and tenable for three years after taking the degree of B.A. A student is elected annually before coming into residence. Amongst the illustrious men connected with this college may be noted Bishop Latimer, John Milton, and Ralph Cudworth, author of the *Intellectual System*.

CHRIST'S HOSPITAL, Newgate street, London, was founded on the site of the Greyfriars' monastery, by Edward VI., June 26, 1553, as a hospital for orphans and foundlings. It is usually called the "blue-coat school," on account of the dress worn by the boys. This consists of a blue woolen gown or coat with a narrow red-leather girdle round the waist, yellow breeches, and yellow stockings, a clergyman's bands at the neck, and a small blue worsted cap, but this last they seldom wear, and are generally seen going about bareheaded—such has been the costume of the boys since the foundation of the school in the reign of Edward VI.; the persistency in it through successive generations, affording a curious instance of the unchangeableness in some of the English usages. No boy is admitted before seven years of age, or after 10, and none can remain after 15, with the exception of "king's boys" (i.e., those who attend the mathematical school founded by Charles II. in 1672) and "Grecians" (i.e., the highest class of scholars in the hospital), of whom eight are sent on various scholarships to the universities of Oxford and Cambridge. Altogether, about 800 boys can be admitted. The

right of presentation is vested in the managing governors. These are the lord mayor of London, the aldermen, and 12 common councilmen. Besides these, all noblemen and gentlemen who benefit the hospital to the extent of £400 are governors. The managing governors are the patrons of several churches, chiefly in Surrey and Essex. The most of the income of C. H., which amounts to about £70,900, is derived from legacies subsequent to its original charter. King Charles' foundation enriched it by £7,000, with an additional annuity of £370 10s., for the purpose of educating yearly 10 boys for the sea-service. Most of the building perished in the great fire of 1666; but, through the generosity of the corporation of London, and the liberal help of wealthy Englishmen, it was soon rebuilt, under the superintendence of sir Christopher Wren. In the course of time, the new hospital fell into decay, and in 1825, a third structure was erected by Mr. Shaw. The great hall of the hospital is a magnificent room, second only to that of Westminster. C. H. is essentially a classical institution, Latin and Greek being the basis of education; but, to satisfy the wants arising from the changed condition of society, the modern languages, drawing, etc., are also taught.

CHRIST'S THORN. See JUJUBE and PALIURUS.

CHRISTUS, oratorio for soli, chorus, organ, and full orchestra, by Franz Liszt, text in Latin; first performed in Rome, July 6, 1867, and first given in its entire form in New York, March 3, 1887. The subject is the life of Christ: the first part a Christmas oratorio; the second, after the Epiphany. The work contains an Easter hymn, *O Filii et Filie*, of much beauty, written in one of the ancient modes.

CHROMATIC, in music, is a term applied to a series of notes at the distance of a semitone from each other. Such a series is produced by dividing the whole tones of the diatonic scale into semitones, so that with the two diatonic semitones, already in the natural scale, the octave is divided into 12 semitones. The word C. is from the Greek, and means colored. Ascending C. passages are formed by the whole tones of the diatonic scale being raised or elevated by a sharp or a natural, according to key, and descending passages by their being lowered by a flat or a natural, thus:

It is usual to speak of the C. scale, but that is wrong, as it is only a melodic progression of semitones, certain notes of which belong to, and form the diatonic scale, showing that the foundation of the system of music does not rest on a C. basis, but on the natural diatonic progression of sounds.

CHROMATIC, in optics. See ACHROMATISM.

CHROMATICS is that part of the science of optics (q.v.) which explains the properties of the colors of light and of natural bodies. Before 1666, when sir Isaac Newton began to investigate this subject, the notions which prevailed respecting the nature of colors were purely fanciful. Till Descartes' time, indeed, it seems not to have been conceived that color had anything to do with light. As examples of the notions prevalent at very early times, we may cite those propounded by Pythagoras and Zeno. According to the former, color was the superficies of bodies; according to the latter, it was "the first configuration of matter"—whatever that may be. It is now settled that white light is not homogeneous, but consists of rays of different colors, endued with different degrees of refrangibility, and that the different colors of bodies arise from their reflecting this or that kind of rays most copiously. According to this, a body that appears red reflects red rays in greater abundance than the others; and one that appears black reflects none of the rays—in other words, absorbs all the light that falls upon it. The analysis of a beam of the sun's light by a prism was the experiment by which Newton demonstrated his great optical discovery of the unequal refrangibility of the variously colored rays, and laid the foundations for the above theory of color. The reader will find an account of this experiment, and of the most interesting phenomena presented by the spectrum, under the article SPECTRUM. Newton concluded from his experiments that white light is composed of seven colors, which he called the primary colors—viz., red, orange, yellow, green, blue, indigo, and violet, and that all other shades of color arise from the admixture of these in different proportions. Sir David Brewster, on the other hand, conceives that he has established that the primary colors are only three in number—red, yellow, and blue. This result he obtained by examining the rays of the spectrum through different absorbing media—a mode of experiment now admitted to be fallacious in principle. Professor Maxwell, by direct examination of the rays, concludes that the three primary colors are red, green, and blue. Recently, a theory has been propounded, that all the colors are the results of the admixture of white light and of shade, or darkness; but as yet no attempt has been made to support this theory by direct experiment on the sun's rays. It is rested on results obtained by combining by motion certain pro-

portions of white and black pigments on a revolving card. See the articles **LIGHT**, **DISPERSION**, and **NEWTON'S RINGS**.

CHROMATROPE (Gk. *chrōma*, color, *tropē*, a turning), is an optical toy, a modified form of the phenakistoscope (q.v.), consisting of a revolving disc, on which are painted circular arcs of various colors. These arcs are arranged in pairs, passing through the centre of motion, no two sets of pairs intersecting in exactly the same way. The result is, that when the chromatrope is made to revolve rapidly, streams of beautiful, brilliant colors seem to flow either to or from the centre of motion, according as the disc is made to rotate in one direction or the opposite. The same principle is utilized in the *chromat-rope slide*, employed in magic lantern exhibitions. In this, two circular discs of glass are placed face to face, each with a design radiating from the centre, and painted with brilliant transparent colors. By a small pinion gearing in toothed wheels or endless bands, the discs are made to move in opposite directions in their own plane. The effect produced is a singularly beautiful change of design and color.

CHROMATYPE (Gr. *chrome*, color; *typos*, impression), a photographic process, thus described by its discoverer, Mr. R. Hunt. One dram of sulphate of copper is dissolved in one ounce of distilled water, to which is added half an ounce of a saturated solution of bichromate of potash; this solution is applied to the surface of the paper, and when dry, it is fit for use, and may be kept for any length of time without spoiling. When exposed to sunshine, the first change is to a dull brown, and if checked in this stage of the process, we get a negative picture; but if the action of light is continued, the browning gives way, and a positive yellow picture on a white ground is obtained. In either case, if the paper, when removed from sunshine, is washed over with a solution of nitrate of silver, a very beautiful positive picture results.

CHROMIC IRON, or **CHROMITE**, $\text{FeO} \cdot \text{Cr}_2\text{O}_3$, ore of chromium, found in Maryland, Pennsylvania, the Shetland islands, Scotland, France, and other places. It usually occurs in mass, but is sometimes crystallized in octahedrons. Oxides of chromium and iron are its ingredients.

CHROMIUM (*chrome*, color) is a metal, so called from the many-colored compounds it produces. It was discovered by Vauquelin in 1797. C. occurs naturally as the chromate of lead, PbCrO_4 , and the chromite of iron, *chrome iron ore*, $\text{FeO} \cdot \text{Cr}_2\text{O}_3$, at Unst and Fetlar in the Shetlands, and Portsoy in Banffshire, etc. The metal has been obtained in powder and in scales, but as a metal it possesses no interest. The principal compound of C. is the bichromate of potash, obtained by heating chrome iron ore in powder with one fourth of its weight of niter, and then digesting in water, which dissolves out the chromate of potash, K_2CrO_4 , a yellow salt, and when this is acted upon by sulphuric acid, it is converted into bichromate of potash, $\text{K}_2\text{Cr}_2\text{O}_7$, readily crystallizes in orange-red crystals, which is soluble in water, and is largely used by the dyer and calico-printer. If this salt be added to a solution of lead, an abundant yellow precipitate occurs of chromate of lead, PbCrO_4 , or *chrome yellow*, which is used largely by the painter as a yellow pigment. A sesquioxide of C. (Cr_2O_3), *chrome green*, possessing a bright green color, which renders it useful in enamel-painting, and being innocuous, it is now introduced into paper hangings instead of the highly dangerous arsenical green pigment. The bichromate of potash is employed in conjunction with sulphuric acid as an agent in bleaching palm-oil and other oils and fats, and also in galvanic batteries.

CHROMO-LITHOGRAPH. See **LITHOGRAPHY**.

CHROMOSPHERE. See **SUN**.

CHRONICLE (from *chronos*, time), denotes a history in which events are treated in the order of time. A C. is understood to differ from annals in being more connected and full, the latter merely recording individual occurrences under the successive years or other dates. Most of the older histories were called chronicles, such as the *Saxon Chronicle*, *Holinshed's Chronicle*. The term is seldom applied to a modern book, but frequently to a newspaper—as, for instance, *The Morning Chronicle*.

CHRONICLES, the name of two of the books of the Old Testament, as found in the common English Bible. In the Hebrew canon the C. form but one book, which is entitled *Events of the Times*—and this appears to have been a designation commonly applied to special histories—in more definite shape, *Events of the Times of King David*, or the like. The Greek translators divided the long Hebrew book into two, and adopted the title *Things Omitted*, that is, not recorded in the other historical books. Jerome suggested the title *Chronicon*, whence comes the English name. The book of C. begins with Adam and ends abruptly in the middle of Cyrus's decree of restoration. The continuation of the narrative is found in the book of Ezra, which fills up the fragment of the decree of the Persian king. Of the authorship of C. nothing is known except what can be determined by internal evidence. The language implies that the book is one of the latest of the Old Testament. In the Hebrew Bible it is placed last. As to the time of the writing of C., it is argued that the chronicler wrote after the fall of the Persian monarchy. What seems to be certain and important for a right estimate of the book is that the author lived a considerable time after Ezra, and stood entirely under the influence of the religious institutions of the new theocracy. This point of view determined the nature of his interest in the early history of his people. The true

importance of Hebrew history had always centered in the fact that this petty nation was the people of Jehovah, the spiritual God. The tragic interest which distinguishes the annals of Israel from the forgotten history of Moab or Damascus lies wholly in that long contest which finally vindicated the reality of spiritual things and the supremacy of Jehovah's purpose, in the political ruin of the nation which was the faithless depository of these sacred truths. After the captivity, it was impossible to write the history of Israel's fortunes otherwise than in a spirit of religious pragmatism. But within the limits of the religious conception of the plan and purpose of the Hebrew history more than one point of view might be taken. The book of Kings looks upon history in the spirit of the prophets. But before the chronicler wrote, the last spark of prophecy had become extinct. The Jerusalem of Ezra was organized no longer as a nation, but as a municipality and a church. The center of religious life was no longer the prophetic word, but the ordinances of the Pentateuch and the liturgical service of the sanctuary. The religious vocation of Israel was no longer national, but ecclesiastical and municipal; and the historical continuity of the nation was vividly realized only within the walls of Jerusalem and the courts of the temple, in the solemn assembly and stately ceremonial of a feast day. These influences naturally operated most strongly on those who were officially attached to the sanctuary. To a Levite, even more than to other Jews, the history of Israel meant above all things the history of Jerusalem, of the temple, and of the temple ordinances. The author of C. betrays in every page his essentially Levitical habit of mind. To such a mind, in the fallen condition of the Jews as a political nation, there seemed to be room for a new history, which should confine itself to matters still interesting to the theocracy of Zion, keeping Jerusalem and the temple in the foreground, and developing the divine significance of the history in its causes and results, not so much with reference to the prophetic word as to the fixed legislation of the Pentateuch, so that the whole narrative might be made to teach that the glory of Israel lies in the observance of the divine law and ritual. For the sake of systematic completeness, the author of the C. begins with Adam; but he had nothing to add to the Pentateuch, and the period from Moses to David contained little that served his purpose. He therefore contracted the early history into a series of genealogies, which were by no means the least interesting part of his work at a time when every Israelite was concerned to prove the purity of his Hebrew descent. From the death of Saul the history becomes fuller, and runs parallel with the books of Samuel and Kings. The limitations of the author's interest in past times appear in the omission, among other particulars, of David's reign in Hebron, of the disorders in his family and the revolt of Absalom, of the circumstances of Solomon's accession, and of many details as to the wisdom and splendor of that sovereign, as well as of his fall into idolatry. In the latter history the ten tribes are quite neglected, and political affairs in Judah receive attention, not in proportion to their intrinsic importance, but according as they serve to exemplify God's help to the obedient and his chastisement of the rebellious. That the author is always unwilling to speak of the misfortunes of good rulers, is not to be ascribed to a desire to suppress the truth, but shows that the book was throughout composed not in purely historical interest, but with a view to inculcate a practical lesson. The more important additions which the chronicler makes to the old narrative consist partly of full details of points connected with the history of the sanctuary and the great feasts, or the archaeology of the Levitical ministry, and partly of narratives of victories and defeats, of sins and punishments, of obedience and its reward, which could be made to point a plain religious lesson in favor of faithful observance of the law. The minor variations of C. from the books of Samuel and Kings are analogous to the larger additions and omissions, so that the whole work has a consistent and well-marked character, presenting the history in quite a different perspective from that of the old narrative. An immense amount of criticism has been expended upon C.; but after all it is safe to conclude, with Ewald and other careful critics, that there is no foundation for the charge that the chronicler invented history in the interest of his practical purpose of exhortation and encouragement. But it is not to be doubted that in shaping his narrative he allowed himself the same freedom taken by other ancient historians, and even by copyists.

CHRO'NOGRAM, or **CHRO'NOGRAPH** (Gr. *chronos*, time, and *gramma*, a letter, or *grapho*, I write), a whimsical device of the later Romans, resuscitated during the *renaissance* period, by which a date is given by selecting certain letters amongst those which form an inscription, and printing them larger than the others. The principle will be understood from the following C., made from the name of George Villiers, first duke of Buckingham.

GEORGIVS. DVX. BVCKINGAMLÆ.

The date MDCXVVVIII (1628) is that of the year in which the duke was murdered by Felton, at Portsmouth. See Hilton, *Chronograms* (1882).

CHRO'NOGRAPH. Different forms of time-measures, or time-recorders, under this designation, have been invented within a recent period.

Benson's chronograph is intended to measure intervals of time down to tenths of a

second, for use at horse-races and other occasions where a seconds watch is not exactly suited. It has an ordinary quick train-lever movement, carrying hands which move over a dial. One of these is a seconds hand, very peculiarly made. The seconds hand is double, consisting of two distinct hands, one superposed on the other. The outer end of the lowermost hand has a small cup with a minute hole at the bottom; while the corresponding end of the uppermost hand is bent over so as exactly to reach this puncture. The little cup is filled with ink, having a consistency between that of writing-fluid and printers' ink. Suppose that a horse-race is about to take place. The observer keeps a steady look-out for the fall of the starter's flag, or whatever the signal may be: he gives a pull to a cord or string connected with the mechanism peculiar to the instrument; by this movement, the outer and bent end of the upper seconds hand dips down through the ink-cup in the lower hand, and through the puncture to the dial. A small black spot or mark is thus made upon the dial-plate; and this is repeated as each horse passes the winning-post. If the eye and hand of the operator are quick and accurate, there is a reliable record thus presented by the instrument of the duration of the race, sometimes as close as one tenth of a second. The instrument is now adopted at the principal races as a suitable one for the purpose; thus it is used for races such as the Derby, the Oaks, the Goodwood, the St. Leger, etc. It is also available for many other purposes.

Strange's chronograph is designed for a more scientific purpose, and constructed with more careful details. The object is to measure extremely short intervals of time, for the determination of longitudes in great trigonometrical surveys. The observer, when a particular star traverses the field of his telescope, touches a small ivory key; and on the instant, a dot or mark appears on a sheet of paper coiled round a barrel. The instrument being connected with an astronomical clock, there is a dot made for every beat of the pendulum; and as these dots are a considerable space apart (considerable, that is, for the refined instruments of the present day), it is possible to determine so wonderfully minute an interval as one hundredth of a second.

Other forms of chronograph have been adopted by astronomers. One was suggested by Prof. C. A. Young in 1866 to assume the functions of a *recording* chronograph, by marking the instant of observation in hours, minutes, seconds, and hundredths of a second, in *printed* characters, and in a form suitable for preservation and reduction.

Chronographs connected with electric and magnetic apparatus are used for determining the velocity of projectiles. Many forms have been devised by Noble, Bashforth, Navez, Le Boulégué, and other inventors. The most general arrangement consists in causing the bullet to pass through a series of screens; the rupture of each screen breaks for a moment the continuity of an electric current, sets in action an electro-magnetic apparatus, and makes a permanent mark or record.

CHRONOL'OGY is the science of the divisions of time. It has two main branches—mathematical C., and historical chronology. Mathematical C. is engaged with such of the units for the measurement of time as begin and end with the period of complete evolution of recurring celestial phenomena. See articles CALENDAR, YEAR, MONTH, DAY, and CYCLE, where the chief points in mathematical C. are explained. Historical C. uses these units among others to measure the distance in point of time between events, and to fix their *dates*. As in geography and navigation, longitude is measured from some arbitrary line, such as the meridian through Greenwich, so in historical C., *dates* are fixed by giving their distance from some arbitrary point of time, usually chosen because of some remarkable occurrence which signalized it. Such a fixed point, or *epoch*, forms the beginning of an *era*. It is thus that *dates* have been aptly said to be to events in history what the latitude and longitude of places are to the places in geography and navigation. The mathematical, or, to speak more properly, the astronomical units of time above referred to have not been, as has been already hinted, the only units used in historical chronology. In early times, the more accurate methods of mathematics were unknown, and such vague periods as "a generation," or the lifetime of leading persons in a nation, such as the priestesses of Juno, or of the kings, were assumed as units in historical chronology. The great variety of eras, too, in ancient times confuses the student of chronology. Thus the era of the Greeks began with the year of the first olympiad, or that in which Corebus was victor; being the first celebration of the games at which the victor's name was recorded, and which is calculated to correspond to the year 776 B.C. From this epoch, the Greeks measured time by olympiads or periods of four years. Thus, the 3d year of the 12th olympiad would be the year 729 B.C. The Roman era was reckoned from the founding of the city, being either 752 or 753 B.C. The Roman practice of dating events from the building of the city, seems to be the first instance of the method of reckoning time from a fixed point by single years. It thus forms one of the great stages in chronology. Of other eras we shall merely mention the Mohammedan, which commences with the flight of Mohammed, 622 A.D., and which is called the *Hedjrah* (q.v.). The Roman and Greek methods of measuring time continued to be in use long after the birth of Christ; the olympiads, indeed, appear to have been employed in Europe down to the 304th olympiad, or 440 A.D. From 312 A.D., however, the public mode of computation throughout the Roman empire was by indictions, which were periods of 15 years, beginning with that year (see INDICTION); and this mode was at one time

almost universally followed in the west. In France, it was not altogether discontinued till the end of the 15th century. The Christian era is said to have been first proposed in the year 527 A.D., and is now universally used in Christendom. Part of the business of C. is to determine the relationships of the different eras, so as to enable one to express, in the language appropriate to one mode of computation, the date of an event recorded in another. Owing to the birth of Christ being a comparatively recent event, the Christian era is attended by this inconvenience, that we must count backwards from it for the dates of occurrences prior to it. To obviate this, various comprehensive periods, such as the Julian and Louisian periods have been invented, which have the merit of being applicable to most events lying within the limits of history. See PERIOD.

Various systems of C., such as the Chinese, Babylonian, Egyptian, Indian, and Chaldean, are worthy of attention. Accounts of the periods which these nations respectively assign to their histories, will be found under the heads CHINESE EMPIRE, BABYLON, etc. Of *sacred C.* there have been various systems. In these the epochs are the creation of the world, and the flood; but the chief copies of the Bible do not agree as to the dates of these events. While the Hebrew text reckons 4,000 years from the creation to the birth of Christ, and to the flood 1656 years, the Samaritan makes the former much longer, though it counts from the creation to the flood only 1307 years. The Septuagint version differs from both. It removes the creation of the world to 6,000 years before Christ, and 2,250 years before the flood. These differences have never been reconciled. It is, now, however, universally admitted, that the creation of the world is not to be regarded as having occurred even so recently as 6,000 B.C. The modern understanding of the first chapter of Genesis leaves the period of the creation quite indefinite, and one scheme of interpretation stretches out the days of creation into periods of indefinite length. Of the *Newtonian C.*, all that can be said here is, that it was an attempt, now generally admitted not to have been very successful, to rectify the obvious blunders of ancient chronologers, by determining certain epochs by means partly of astronomical calculations, and partly of the critical examination of such chronicles as measured time by reigns and generations. By a very fine argument, the soundness of which has since been doubted, Newton set down the date of the Argonautic expedition as being 43 years after the death of Solomon, or 937 B.C.

The exact chronology as to many periods is largely conjectural. The Christian era (q.v.) starts at the birth of Christ. The years before are marked B.C. and those after, A.D. (Anno Domini). This era is now almost universally accepted. The Olympiad was a Greek era in periods of four years; the birth of Christ occurred in the middle of the fourth (some say in the second or third) year of the 194th Olympiad. The era of the foundation of Rome is usually assigned to 753 B.C. The era of the creation is fixed at many widely varying points. The reckoning of Constantinople, which is still used by the Greek church, makes it 5509 B.C.; the Abyssinian church, 5492; the Alexandrian church, 5502, and later 5492; the Jews, 3761. One writer on the C. of sacred history collected more than 200 different estimates of the era of the creation, the shortest being 3483, and the longest 6984 B.C. If such or such a date from the creation means anything, it is probably to be read by the period fixed by Dr. Usher, which was 4004 B.C. Yet it must be understood that, on this point, we are without the data for an accurate and positive chronology. There is an era of the creation used in India, which is only 3102 B.C. The era of Vicramyditya in common use in India begins 56 B.C. The Spanish era, dating from the conquest of Spain by Augustus, 38 B.C., was in use in Spain, Portugal, North Africa, and Southern France. The era of Diocletian, or of the martyrs, is dated 284 A.D. The Mohammedan era, beginning at the time of the prophet's flight to Medina, is 622 A.D. As reckoned by our ordinary C., the precise dates of commencing the above and other eras are:

Grecian, Mundane.....	Sept. 1,	5598	B.C.
Constantinople, Civil.....	Sept. 1,	5508	"
Alexandrian.....	Aug. 29,	5502	"

Mohammedan, Hegira	July 16,	622 "
Persian of Yezdegird.....	June 16,	632 "

CHRONOMETER, or time-measurer, is the name given principally to such time-keepers as are used for determining the longitude at sea. The mechanism is essentially the same as that of a common watch; only the size is generally greater, and the balance-wheel is compensated for variations of temperature. See **HOROLOGY**. See *illus.*, **CIRCLE**, **MERIDIAN**, ETC., vol. III.

CHRONOSCOPE, an instrument contrived by sir Charles Wheatstone to measure the duration of certain short-lived luminous phenomena, such as the electric spark, of which the eye itself can be no judge, owing to the persistence of impressions of light on the eye after the cause of sensation has ceased. The phenomenon is observed by reflection in a mirror, in such rapid motion that the image of the luminous object would appear to describe a circle, supposing the luminosity to endure long enough. Should the phenomenon be instantaneous, the image will appear as a mere point; should it last for an appreciable time, the image will form an arc, greater or less, of the circle. The electric spark is found by this test to have no duration.

CHRYsalis, or **CHRYsalid**, a name originally Greek, and strictly belonging to those *pupæ* of butterflies which are adorned with golden spots, but extended to the pupæ of lepidopterous insects generally, and even of other orders of insects. The chrysalids of lepidopterous insects are inclosed in a somewhat horny membranous case; sometimes very angular, sometimes nearly round; generally pointed at the abdominal end, sometimes at both ends; and before the caterpillar undergoes its transformation into this state, it often spins for itself a silken cocoon, with which earth and other foreign substances are sometimes mixed, so as to increase its size, and within which the chrysalid is concealed. See **LEPIDOPTERA**; **BUTTERFLY**; **HAWK-MOTH**; **MOTH**; and **SILK**.

CHRYSANTHEMUM. A name derived from two Greek words signifying *golden-flowered*, and given to the yellow florets of the species to which it was originally applied. The species are natives of northern Europe, the Canary Isles, East Africa, and the mountain and boreal region of Asia. Comparatively few occur in warm climates. About 150 species have been described by botanical authors, but according to the best authorities not more than 80 of these are worthy of being retained.

The genus as arranged by Bentham and Hooker is divided into five subordinate sections, which are founded upon variations in the form of the akenes and the amount of the pappus, and these comprise the 24 genera into which they were formerly separated by botanists under as many distinct names. It belongs to the Order *Compositæ*, and is characterized by heterogamous heads, with ligulate ray flowers in one row and mostly pistillate and sterile, perfect disk florets, naked receptacles, flat or hemispherical, akenes 5-10 ribbed, triquetrous or three winged, with or without a variously formed pappus. The plants are free bloomers both in the wild and cultivated state. The heads are solitary on long peduncles, or corymbose. Usually the rays spread wide open and are conspicuously showy; white, yellow or rose-purplish in tint, while the disk flowers are for the most part yellow.

None of the species are indigenous to the United States, but seven or eight have been introduced from abroad, and have become more or less extensively naturalized. The best known of these is *C. Leucanthemum* L., or ox-eye daisy, which grows abundantly in pastures throughout the Atlantic states. It is known to farmers as white-weed, and by many regarded as a great pest which it is difficult to eradicate from mowing fields. Another species, *C. vegetum* L., the corn-marigold of Europe, which bears pretty golden ray and disk florets, has been found running wild over fields at Oakland, California. An elegant species from the Canaries, *C. frutescens* L., known in France as Marguerite, and widely cultivated in that country for ornamental purposes, has found its way into other lands, and is grown either in pot culture or, where the climate will allow, in the open air. The writer saw it in close hedges, three or four feet high, growing vigorously in the plazas of Valparaiso and Copiapo, Chile.

The chrysanthemum has, of late, become as much of a popular craze in portions of Germany, in England, and the United States as ever was the tulip in Holland. The Chinese and Japanese species, *C. Indicum*, and *C. Sinensis*, are the prolific parents of the almost innumerable forms which adorn our gardens, parks, and houses, and which give rise to the gorgeous autumnal exhibitions that are held in London, Boston, New York, and Philadelphia. The diversity of color, shape, and size which have been developed in these flowers is simply amazing, over 500 distinct varieties having been, it is stated, produced at one exhibition alone. They range all the way from the pompon, or button form, to the huge head that measures nearly eight inches in diameter, and with ray florets three or four inches in length, each head enough of itself to constitute a bouquet. In shape they are quilled or plain, double, semi-double, and single, with florets erect or reflexed. In color they present all the hues of the rainbow, some of them in brilliancy

and combination of tints rivalling the plumage of tropical birds. In shape there are scarcely any bounds to the curious and elegant varieties which have been developed. Now they have the appearance of fleecy balls, now the slender rays of one color spread out horizontally, while the disk florets of a different hue twist about themselves spirally; and again others have the appearance of tassels composed of various sorts of richly colored silk, while others still seem constructed of strips of gaudy paper or fringed ribbons. The species are generally wanting in fragrance, but recently gardeners have succeeded in producing several varieties which are said to exhale a strong violet scent, and probably it is only a question of time when this quality will be developed to a greater degree, so flexible are these flowers in the hands of a skilful florist. The different varieties are obtained from seedlings, and hybridization is seldom resorted to, the variations occurring spontaneously. With these seedlings in hand, the main effort among competitors for prizes is to raise large flowers and high and symmetrical pot plants, and these are secured principally by careful pruning, disbudding and potting at the right season.

It is not strange that the chrysanthemum should be popular. The propensity of the flowers to sprout constantly stimulates the expectation of varieties. They are of the easiest culture, growing in any garden soil. They blossom late in the year, and fill the parlor with bloom at a season when everything else fails.

CHRYSE, the name given by the ancients to regions now known as Indo-China. It is a literal version of the Sanskrit Suvarnabhumi, or Golden Land, applied in ancient India to those regions.

CHRYSELEPHANTINE (Gr. from *chrysos*, gold, and *elephas* ivory), the art of making images of gold and ivory, was extensively practiced amongst the Greeks. Winckelmann has calculated that about 100 statues of this kind are mentioned by the ancients. The colossal works executed by Phidias at Athens, in the time of Pericles, are the most famous of this class, the greatest being the Pallas of the Parthenon. It was 26 cubits high, and represented the goddess in armor, covered with a long robe. The famous Olympian Jupiter of Phidias, executed in the same materials, was also a world-wide wonder. The combination of gold and ivory was chiefly used in temple statues; and though the execution of the more famous works of this class belongs to an advanced period of art, the use of various materials in the same statue was very ancient, and probably borrowed from the custom of adorning the wooden images of the earliest time with the precious metals. See SCULPTURE.

CHRYSIP PUS, an eminent Stoic philosopher, was b. about 280 B.C., at Soli in Cilicia. He came to Athens when still a youth, and eagerly addicted himself to philosophical pursuits. His principal master was Cleanthes, although he is said to have also studied under the academic teachers, Arcesilaus and Lacydes, and learned from them what were the objections urged by skeptics against the doctrines of the Stoics. He had the reputation of being the keenest disputant of his age, and was happily described as "the knife for the academic knots." In fact, his logic was held to be so convincing, that people were wont to say: "If the gods make use of dialectic, it can only be that of Chrysippus." It is also related of him, that he told Cleanthes he merely wanted to know the principles of his system, as he intended to find arguments for them himself; and this story appears to indicate his true position in philosophy. He was not the creator of a new system, but the expounder of an old. C.'s industry was very great. He seldom wrote less than 500 lines a day, and is said to have composed more than 700 works. Many of these, however, were compilations, and were not characterized by great beauty of style. Only a variety of fragments remain, which have been edited by Petersen (*Philosophie Chrysippeæ Fundamenta*, Altona and Hamburg, 1827).

CHRYSIS, a Linnæan genus of hymenopterous insects, now constituting a family *chrysidæ*, allied to the *ichneumonidæ*, and forming a connecting-link between them and bees, wasps, etc. The French call them *Guêpes dorées* (gilded wasps), and they sometimes receive the English names of *golden-tailed* and *ruby-tailed flies*. They delight in sunshine, and may be seen poised in the air—the motion of their wings being so rapid as to render the body alone of the insect visible.

CHRYSOBALANA CEE, or CHRYSOBALANÆ, according to some botanists, a distinct natural order of plants; according to others, a sub-order of rosacæ (q.v.). They are distinguished from the other plants usually included in the order rosacæ by their irregular petals, and by having the stamens also irregular, either in size or position; the ovary stalked, its stalk adhering on one side to the calyx, the style proceeding from its base. The fruit is a drupe of one or two cells. The species are trees or shrubs, natives generally of tropical and sub-tropical regions. About 50 species are known. The fruit of many is eatable, as the cocoa plums (q.v.) of the West Indies (*chrysobalanus*), the fruit of *parinarium excelsum* in Sierra Leone, and that of *moquilea grandiflora* in Brazil. The kernels of some resemble sweet almonds, as those of *parinarium canpestre* and *P. montanum*. A useful oil is expressed from the seeds of *princepsia utilis*, a spiny plant.

CHRYSOBERYL, a gem almost as hard as sapphire, and the finer specimens of which are very beautiful, particularly those which exhibit an opalescent play of light. Lapidaries sometimes call it oriental or opalescent chrysolite. It is of a green color, inclining to yellow, semi-transparent, or almost transparent, and has double refraction. It occurs crystallized in six-sided prisms; often in macles, or twin crystals. It is found in granite, in sandstone, and in alluvial soil; in Ceylon, Pegu, Siberia, Brazil, and Connecticut. It

is composed of alumina, glucina, and a little protoxide of iron; the alumina being about 80 per cent of the whole.

CHRYSOCCOLLA, or **COPPER-GREEN** (Gr. gold-glue), an ore of copper, found in Cornwall and in many parts of the world, but particularly in Wisconsin and Missouri, where it is so abundant as to be worked for copper.

CHRYSOLEITE (Gr. golden-stone), a mineral composed of silica, magnesia, and protoxide of iron; of a fine green color, with vitreous luster; transparent, and having double refraction; in hardness, about equal to quartz; and with conchoidal fracture. It often crystallizes in four-sided or six-sided prisms, variously modified. Very fine specimens are brought from Egypt and from some parts of the east, also from Brazil. C. is used by jewelers as an ornamental stone, but is not highly valued. *Olivine*, which occurs generally massive, in grains and roundish pieces, and is frequent in volcanic countries, and found in the igneous rocks of some parts of Scotland—as on Arthur's Seat—is regarded as a coarse variety of chrysolite.—The chrysoberyl (q.v.) is sometimes called C. by jewelers.

CHRYSOLORAS, **MANUEL**, a learned Greek of Constantinople, was b. in the middle of the 14th century. He is regarded as the first who transplanted Greek literature into Italy. About the year 1391, the Byzantine emperor, John Paleologus, sent C. to England and Italy to entreat assistance against the Turks. This mission made C. known in Italy, and, in 1397, he left his native land and went to Florence, where, as teacher of Greek literature, he was highly esteemed and admired. Leonardo Bruno, Poggius, Philelphus, Guarinus of Verona, and other eminent scholars, were pupils of his. He was afterwards employed in public services—especially in mediating a union of the Greek with the Roman church—by Pope Gregory XII. In 1413, C. went with John XXII. to the council of Constance, where he died 1415. Besides theological works, his *Erotemata*, or “Accidence of the Greek Language” (Venice, 1484), has been preserved. Manuel C. must be distinguished from his nephew, **JOHN CHRYSOLORAS**, who also went to Italy and gave lessons in Greek.

CHRYSOMELA and **CHRYSOMELINÆ**. See **GOLDEN BEETLE**.

CHRYSOPHYLLUM. See **SAPOTACEÆ**, **MONESIA BARK**, and **STAR APPLE**.

CHRYSO PRASE is merely a variety of chalcedony, but is valued far above common chalcedony as an ornamental stone; so that a stone of this kind, fit for mounting in a ring, is worth from \$50 to \$100. It is of a fine apple-green color in choice specimens, but inferior ones exhibit other shades of green, and it is sometimes spotted with yellowish-brown. It is often set in a circlet of diamonds or pearls. Unfortunately, it is apt to lose its color through time, particularly if kept in a warm place; but dampness is favorable to its preservation, and it is therefore sometimes kept in damp cotton. It is found in lower Silesia—where the search for it was particularly encouraged by Frederick the Great—and in Vermont. The inferior specimens are made into brooches, necklaces, etc.; and those still coarser, into snuff-boxes, seals, cups, etc.—The C. of the ancients was a stone of yellowish-green color, but it is not certain what it was.

CHRYSO OPS. See **CLEG**.

CHRYSO STOM, **JOHN** (Gr. *Chrysostomos*, golden-mouth; so named from the splendor of his eloquence), was b. at Antioch in 347 A.D. His mother Anthusa was a pious woman, wholly devoted to her son, who grew up under her loving instructions into an earnest, gentle, and serious youth, passing through, as Neander significantly observes, none of those wild, dark struggles with sinful passions which left an ineffaceable impress on the soul of Augustine, and gave a somber coloring to his whole theology. He studied oratory under Libanius, a heathen rhetorician; soon excelled his teacher; and, after devoting some time to the study of philosophy, retired to a solitary place in Syria, and there read the Holy Scriptures. The ascetic severity of his life and studies brought on an illness which forced him to return to Antioch, where he was ordained deacon by Bishop Meletius in 381, and presbyter by Bishop Flavianus in 386. The eloquence, earnestness, and practical tone of his preaching excited the attention of Jews, heathens, and heretics, and secured for him the reputation of the chief orator of the eastern church. In 397, the eunuch Eutropius, minister of the Emperor Arcadius, who had been struck by the bold and brilliant preaching of C., elevated him to the episcopate of Constantinople. C. immediately began to restrict the episcopal expenditure in which his predecessors had indulged, and bestowed so large a portion of his revenues on hospitals and other charities, that he gained the surname of “John the Almoner.” He also endeavored to reform the lives of the clergy, and sent missionaries into Scythia, Persia, Palestine, and other lands. His faithful discharge of his duties, especially in reproof of vices, excited the enmity of the patriarch Theophilus and of the Empress Eudoxia, who succeeded in deposing and banishing him from the capital. He was soon recalled, to be banished again shortly afterwards. He now went to Nicæa, in Bithynia; but was from thence removed to the little town of Cucusus, in the desert parts of the Taurus mountains. Even here his zeal was not abated. He labored for the conversion of the Persians and Goths in the neighborhood, and wrote the seventeen letters (or rather moral essays) to Olympias, to whom he also addressed a treatise on the proposition—“None can hurt the man who will not hurt himself.” The emperor, enraged by the general sympathy

expressed towards C. by all true Christians, gave orders that he should be more remotely banished to a desolate tract on the Euxine, at the very verge of the eastern Roman empire. Accordingly, the old man was made to travel on foot, and with his bare head exposed to a burning sun. This cruelty proved fatal. C. died on the way at Comanum, in Pontus, Sept. 14, 407 A.D., blessing God with his dying lips. The news of his death excited much sorrow among all pious Christians, for C. was a man who drew the hearts of his fellows after him; a lovable, manly Christian, hating lies, worldliness, hypocrisy, and all manner of untruthfulness, with that honest warmth of temper which all vigorous people relish. A sect sprang up after his death, or martyrdom as they conceived it, called *Johannists*, who refused to acknowledge his successors; nor did they return to the general communion till 438, when the Archbishop Proclus prevailed on the emperor Theodosius II. to bring back the body of the saint to Constantinople, where it was solemnly interred, the emperor himself publicly imploring the pardon of heaven for the crime of his parents, Arcadius and Eudoxia. The Greek church celebrates the festival of C. on the 13th of Nov.; the Roman, on the 27th of January. In his *Homilies* (Thomas Aquinas said he would not give in exchange those on St. Matthew for the whole city of Paris) C. displays superior powers of exegesis. In general, he rejects the allegorical system of interpretation, and adheres to the grammatical, basing his doctrines and sentiments on a rational apprehension of the letter of Scripture. He is, however, far from being a bibliolater. He recognized the presence of a human element in the Bible as well as a divine; and instead of attempting, by forced and artificial hypotheses, to reconcile what he thought irreconcilable in Scripture statements, he frankly admitted the existence of contradictions, and shaped his theory of inspiration accordingly. But his greatest and noblest excellence lay in that power, springing from the fervor and holiness of his heart, by which the consciences of the proud, the worldly, and the profligate were awakened, and all were made to feel the reality of the gospel message. The surname C. was first applied some time after his death, and, as it is supposed, by the sixth oecumenical council in 680. C.'s works are very numerous, and consist of, 1st, *Homilies*, on parts of Scripture and points of doctrine; 2d, *Commentaries*, on the whole Bible (part of which has perished); 3d, *Epistles*, addressed to various people; 4th, *Treatises*, on different subjects (such as Providence, the Priesthood, etc.); and 5th, *Liturgies*. Of these the most valuable, as well as the most studied, are the *Homilies*, which are held to be superior to everything of the kind in ancient Christian literature.

The most correct Greek edition of C.'s works is that by Henry Savil (8 vols., Eton, 1613); and the most complete Greek and Latin edition is that by Montfaucon (13 vols., Par. 1718-38; republished in 1834-40). The best authority in regard to C. is Neander, who, besides treating of his life and labors in his *Kirchengeschichte*, published a life of this eminent father.

CHRYSTYPE (Gr. *chrysos*, gold; *typos*, impression), a photographic process invented by sir John Herschel, and depending for its success on the reduction of a persalt of iron to the state of protosalt by the action of light, and the subsequent precipitation of metallic gold upon this protosalt of iron. The process is conducted as follows: Good paper is immersed in a solution of ammonio-citrate of iron of such a strength as to dry into a good yellow color, without any tinge of brown in it. It is then exposed to light under a negative until a faint impression is obtained. A neutral solution of chloride of gold is then brushed over the paper, when the picture immediately appears, and is rapidly developed to a purple tint. It should then be freely washed in several changes of water, fixed with a weak solution of iodide of potassium, again thoroughly washed and dried. The action of the iodide of potassium is to convert any unaltered chloride of gold into a soluble double iodide of gold and potassium, thus rendering the picture permanent.

CHRZANOWSKI, ADALBERT, 1788-1861; a native of Poland, who participated in Napoleon's Russian campaign, in the engagements at Leipsic, Paris, and Waterloo. After Napoleon's final defeat he served in the Russo-Polish army, and was under Diebitsch in Turkey in 1829. In the Polish revolution of 1830 he served with distinction, rose to the rank of gen. of division, and was made governor of Warsaw. He fell under suspicion of friendliness to the Russians, and was from time to time under a sort of ostracism. In 1849, he was chosen by Charles Albert commander-in-chief of the Sardinian forces in the short-lived revolution of that period. Ramorino and C. were charged with treachery, and the former was put to death. Some years later C. emigrated to the United States. He died in Paris.

CHUB, *Leuciscus cephalus*, a fish of the family *cyprinidæ*, of the same genus with the roach, dace, bleak, minnow, etc. See **LEUCISCUS**. The color is bluish-black on the upper parts, passing into silvery white on the belly; the cheeks and gill-covers rich golden yellow. The C. rarely attains a weight exceeding 5 lbs. It is plentiful in many of the rivers of England, and occurs in some of those of the s.w. of Scotland. In the rivers of Cumberland it bears the name of *skelly*, supposed to have reference to the size of its scales; but the schelly of Ullswater lake is the gwyniad, and the C. is there called the *chevin*. It is found in many rivers of the continent of Europe; being the *gentling* or *bratfisch* of the Danube, and the *jese* of the Oder. It spawns in April and May. It is not in great esteem for the table.

CHUBB, CHARLES, locksmith, was patentee of several improvements in "detector" locks originally patented by his brother, Jeremiah Chubb, of Portsea, in 1818. He was in the hardware business at Winchester and Portsea, previous to his settlement in London, where he died, 16th May, 1845. Under his son and successor, John Chubb (1816-72), further patents were taken out and improvements made in locks and safes, and the business was greatly developed.

CHUBB, THOMAS, an English rationalist, who wrote on religious questions during the first half of the last century, was b. at East Harnham, in Wiltshire, in 1679. He received but a meagre education in youth, and, after an apprenticeship to a leather glove and breeches maker in Salisbury, he became a tallow-chandler, in which business he continued to the end of his life. His first work, published in 1715, was entitled *Supremacy of God the Father Vindicated*. Besides this, he wrote a multitude of treatises on other religious subjects. Among these may be mentioned: *A Discourse on Reason, as a sufficient Guide in matters of Religion; On Sincerity; On Future Judgment and Eternal Punishment; Inquiry about Inspiration of the New Testament; and Doctrine of Vicarious Suffering and Intercession Refuted*. C. died in 1747.

CHUCK-WILL'S-WIDOW, *Antrostomus Carolinensis*, a bird of the goatsucker family (*caprimulgidae*), a native of the southern parts of the United States. It has received its singular name from its note, which resembles these words or syllables articulated with great distinctness, and is repeated like that of the cuckoo, or of its own congener, the whip-poor-will (q.v.).

CHUCUITO, or **CHUQUITO**, a town of Peru, in the department of Puno, and 100 m. e.n.e. of Arequipa, on the w. shore of lake Titicaca, at the mouth of a stream flowing from the Andes. It was formerly of much greater size and importance than it is at present, having had, it is said, at the beginning of the 18th c., the incredible number of 300,000 inhabitants. Its present pop. is only about 5,000. In the province of the same name, of which it is the capital, there are mines of silver and gold, and interesting antiquarian remains.

CHUMBUL', a river rising in the Vindhyan mountains, which form the southern limit of the basin of the Ganges. Its source, at a height of 2,019 ft. above the sea, is in lat. 22° 26' n., and long. 75° 45' east. During a generally n.e. course of 514 m., it receives many tributaries on both sides, till, in lat. 26° 30' n., and long. 79° 19' e., it enters the Jumna from the right, with such a volume of water, that, when itself flooded, it has been known to raise the united stream 7 or 8 ft. in twelve hours. The C. is remarkable, here and there, for the wildness of its current and the picturesque character of its banks.

CHUNAM', the Indian name for a very fine kind of quicklime made from calcined shells or from very pure limestone, and used for chewing with betel (q.v.), and for plaster. Both recent and fossil shells are used for making chunam. Extensive beds of fossil shells employed for this purpose occur in the s. of India, particularly in low marshy situations near the sea-coast. The shells used are in the first place very carefully cleaned; they are then calcined in kilns, with wood charcoal. When chunam is to be used for plaster, it is mixed with fine river-sand, and thoroughly beaten up with water. A little *jaggery* (coarse sugar) is also added.

CHUNARGURH', or **CHANAR**, a fortified t. on the right bank of the Ganges, 16 m. to the s.w. of Benares, and in the division of that name. It is in the district of Mirzapore, and lieutenant-governorship of the north-west provinces. The population of the town in 1891 amounted to 11,400. The fortress, which occupies the summit of a sandstone rock, contains the commandant's house, the hospital, the prison, and an ancient palace, with a deeply excavated well of indifferent water. The river in front is navigable at all seasons for vessels of from 50 to 60 tons.

CHUND, or **CHAND**, a Hindu writer of the 12th c., court poet to the last of the Hindu sovereigns of Delhi. He wrote in verse an immense encyclopædic work, including a history, and especially an account of the exploits of the author and of his master.

CHUPRA, a t. in India, in the province of Behar, Bengal, on the n. bank of the Ganges, 35 m. n.w. of Patna. It extends nearly a mile along the river, and has several pagodas, mosques, and churches. There is trade in cotton, sugar, and saltpeter. Pop. '91, 57,352.

CHUQUISA'CA, or **SU'CRE**, the capital of Bolivia or Upper Peru, in lat. 19° 20' s., and long. 65° 30' west. It is situated on a table-land about 9,000 ft. above the sea, and has a pleasant climate. The town is well built, has a cathedral of great magnificence, a university, a college of arts and sciences, and a mining-school. C. was founded in 1538 by Pedro Auzures, an officer of Pizarro's, on the site of an old Peruvian town called "Choque Chaka," or "bridge of gold," "the treasures of the Incas having passed through it on their way to Cuzco." At one time, C. bore the name of La-Plata, on account of the rich silver mines in its vicinity. Pop. 20,000. C. gives name to a territory containing 286,710 whites, besides many native Indians. Near it are platinum and silver mines in operation; and in it are magnificent ruins of unknown origin. The second name is derived from the general who, in Dec., 1824, fought and won the last great battle for colonial independence at Ayacucho.

CHUR (Fr. *Coire*, anct. *Curia Rhetorum*), a t. of Switzerland, capital of the Grisons, in the valley of the Upper Rhine, in a fertile plain about 2000 ft. above the sea, and surrounded by high mountains, 60 m. s.e. of Zurich, on the Plessur, about a mile from its junction with the Rhine. It is of importance as standing on the great road to Italy by the Splügen and Bernardin passes, and thus possessing a considerable transit trade. C. stands on uneven ground, has narrow streets, and is divided into a high and low town. The bishop's palace, and the quarter around it, inhabited by the Roman Catholics, occupy the summit of an eminence, and are separated from the rest by walls and battlements, closed by double gates. In the same quarter stand the old cathedral, a round, arched, or Byzantine edifice, founded in the 8th c.; the church of St. Lucius or the *Dom*, a curious example of early pointed Gothic, including fragments of earlier buildings. It contains singular old carving, paintings, and statues, and also, it is said, the bones of St. Lucius, who was a British king. Behind the episcopal palace is a kind of ravine lined with vineyards. In the lower town there are also some very ancient buildings. Romansch is still spoken in the vicinity; a newspaper in this dialect is published in the town; and a considerable collection of Romansch literature is to be found in the library of the cantonal schools. There are several new roads leading in different directions through the Grisons; and a railway connects the town with Zurich and other places. There are manufactures of zinc wares and cutting tools. Population about 9400.

CHURCH, a word which signifies either a place of Christian worship or a collective body of Christian people. It is, in all probability, derived from the Greek adjective *kyriakos* (from *kyrios*, lord), the place of worship having been called *the Lord's house*, and the worshipers *the Lord's people*. The Scottish *kirk*, the German *kirché*, etc., are merely different forms of it.

Under the terms *apse* and *basilica* (q.v.), we have already explained that the earliest ecclesiastical structures of the Christians were copied or adapted not from the heathen or Jewish temple, as might have been anticipated, but from that peculiar combination of a hall of justice and a market-place to which the name *basilica* was given by the ancients. The reason of this selection is probably to be found, not so much in the spirit of opposition which no doubt existed between Christians and heathens, as in the essentially different conceptions which they formed of the character and objects of public worship. The rites of heathendom were performed exclusively by the priest, the people remaining without the temple; and the temple itself, which was lighted only from the door, or by the few lamps which burned around the image of the god, was regarded not as a receptacle for worshipers, but as the abode of the deity. The dark, mysterious character which thus belonged to it, rendered it equally unsuitable for the performance of liturgical services in which the people were to participate, and for the delivery of those public addresses which from the beginning were employed as a means of Christian teaching and exhortation. To such purposes, the prætor's court-room, with its surroundings, were readily adapted, by the few simple alterations which we have described in the articles referred to. But the *basilica*, as thus altered, was a mere utilitarian structure. It served the purposes of Christian worship, but there was nothing in its form which responded to the feelings of Christian worshipers, or tended to awaken Christian sentiments. Now, the cross (q.v.) had been used by Christians from a very early period to indicate their allegiance to the author of their salvation and the object of their faith; and gradually it had become the distinctive emblem of Christianity. Nothing, then, could be more natural than that when it became desirable to give distinctively Christian characteristics to what hitherto had been a heathen structure, this should be effected by such a modification of its form as should convert it into a representation of this sacred emblem. Nor did this alteration lead to any very extensive change on the form of the C., as it had hitherto existed. The *basilica*, as we have already explained, not unfrequently had side entrances, either in place of, or in addition to, that from the *æd.* All that was requisite, then, to convert the simple parallelogram of which it consisted into a cross, was, that at each side of the building these entrances, in place of direct communications with the exterior, should be converted into passages, or arms running out at right angles, and more or less prolonged, according as the object was to attain the form of a Greek or of a Latin cross (see *Cross*). If the C. was to be in the form of a Greek cross, the arms were made of the same length with the other two portions into which they divided the building; whereas if the cross was to be a Latin one, the portion of the building which ran towards the w. was made considerably longer than either of the others. In either case, the arms running at right angles to the C., and directly opposite to each other, cut it across, and thus obtained the name of *transepts*.

The external form of the C. being thus indicated, we now proceed to explain its internal arrangements, and to enumerate the various adjuncts which in cathedrals and others of the larger churches frequently sprang up around it.

Over the point at which the arms or transepts intersect the body of the cross, a central tower or spire is very frequently erected. From this central tower, or, if the tower or towers are situated elsewhere, from this central point, the portion of the building which runs westward, to where the Galilee or entrance chapel, or, in other instances, the

great entrance-door is situated, is called the nave (from *navis*, a ship), whilst the portion which runs eastward to where the altar, or high-altar, if there be several, is placed, is called the choir. In the larger and more complete churches, the nave, and frequently also the choir, are divided longitudinally by two rows of pillars into three portions, the portion at each side being generally somewhat narrower and less lofty than that in the center. These side portions are called the aisles of the nave, or of the choir, as the case may be. In some churches, the aisles are continued along the transepts, thus running round the whole C.; in others, there are double aisles to the nave, or to both nave and choir, or even to nave, choir, and transept. Behind, or to the e. of the choir, is situated the Lady's chapel, or chapel of the Virgin, with sometimes a number of altars; and it is not unusual for side chapels to be placed at different places along the aisles. These usually contain the tombs of the founder, and of other benefactors to, or dignitaries connected with, the church. The extent to which these adjuncts exist depends on the size and importance of the C., and they are scarcely ever alike in two churches, either in number, form, or position. Vestries for the use of the priests and chorists generally exist in connection with the choir. Along the sides of the choir are ranged richly ornamented seats or stalls, usually of carved oak, surmounted with tracery, arches, and pinnacles; and amongst these seats, in the case of a bishop's church, the highest and most conspicuous is the so-called *cathedra*, or seat for the bishop, from which the cathedral takes its name. The larger English cathedral and abbey-churches have usually a chapter-house attached to them, which is of various forms, most commonly octagonal, and is often one of the richest and most beautiful portions of the whole edifice. On the continent, chapter-houses are not so common, the chapter (q.v.) being usually held in the cathedral itself, or in one of the chapels attached to it. Cloisters (q.v.) are also frequent, and not unusually the sides of those which are furthest removed from the C. or chapter-house, are inclosed by other buildings connected with the establishment, such as a library, and places of residence for some of the officials of the cathedral. It is here that, in Roman Catholic churches, the hall, dormitories, and kitchens for the monks are commonly placed. Beneath the C. there is frequently a crypt (q.v.). In some cathedral churches, the crypt is in reality a second underground C. of great size and beauty. The baptistery (q.v.) is another adjunct to the C., though frequently forming a building altogether detached. Most of the parts of the C. which we have mentioned may be traced; but it must not be supposed that their position is always that which is there represented. The position of the nave, choir, or chancel, aisles, and transepts are nearly invariable, but the other portions vary, and are scarcely alike in two churches.

Churches are of five classes—metropolitan, cathedral, collegiate, conventual, and parish churches—and of these the first are, generally speaking, the most, and the last the least elaborate. In ordinary language, any building set apart for religious ordinances is called a church, though when of a minor kind it is more usually designated a chapel. After a long period of neglect and poverty of taste, the building of churches in a superior style, emulative of the older styles of architecture, has greatly revived, not only as regards the church of England, but the church of Scotland and nearly all dissenting bodies.

As applied to a collective body of Christian people, the word C. is the translation and equivalent of the Greek word *ecclesia* (Lat. *ecclesia*, Fr. *église*), used in the New Testament. It is common among Protestants to distinguish between the *visible* and the *invisible* C.—the invisible C. consisting of all those who are savingly or spiritually united to Christ, that is, of all true believers; the visible C. consisting of all who profess the religion of Jesus Christ. Roman Catholics do not in the same manner acknowledge the distinction between the visible and the invisible C., but regard a connection with the hierarchy, and consequent participation of ordinances, as establishing a connection with the true C. and with Christ. Protestants regard the C. as subsisting from age to age, in virtue of the authority of Christ, and through the faith of individual believers and their confession of him; Roman Catholics regard the apostolical succession of the hierarchy, and the regular administration of the sacraments, as essential to the continued existence of that *Catholic* or universal C. which Christ planted on the earth, and the existence of which he has promised to maintain throughout all ages. Protestants, in general, regard the C. of Rome and the Greek C. as forming part of the visible C. of Christ; but Roman Catholics are not accustomed to make a corresponding admission with respect to the Protestant churches. From the hierarchical principle of the C. of Rome and of the Greek C., results an employment of the term C. to designate the hierarchy alone, which is contrary to the principles of the reformation, although a tendency to it may be observed in some Protestant churches. It has been usual for Protestants to designate, by the term C. the collective body of Christians in a particular country, distinguished by the name of that country; the greater number of Protestants (Episcopalians and Presbyterians) believing that such a portion of the universal C. may warrantably be associated under a common government; and in countries where religious liberty exists, diversities of opinion on points of doctrine and C. government have given rise to the existence of separate Christian associations, distinguished by names generally indicative of some of the peculiarities which characterize them; but these, however much they may differ on many points, do not in general hesitate to recognize each other as belonging to the universal visible C. of

Christ, whilst they retain in common the same great first principles of the Christian faith, and particularly the belief in one God and in the three persons of the Godhead, the incarnation of the Son of God, the atonement by Jesus Christ, and the work of the Holy Spirit. The term C., however, is regarded by Independents (q. v.) or Congregationalists as more strictly applicable to those who are united as worshipers in a particular place of worship, partaking of the Lord's supper together, and exercising discipline and C. government among themselves.

CHURCH, BENJAMIN, 1639-1718; a New England soldier who served with distinction in King Philip's war, and was commander in the fight in which Philip was killed. He commanded a number of expeditions against the Indians of New Hampshire and Maine. From his dictation and memoranda his son wrote a history of King Philip's war.

CHURCH, FREDERICK EDWIN, b. Conn., 1826; a pupil of Thomas Cole and a painter of eminence. The works which gave him prominence are a "View of East Rock, near New Haven," and "Scenes in the Catskill Mountains." He visited South America in 1853 and 1857; and in Ecuador and New Granada made sketches for a number of paintings, some of which have attained great celebrity, such as the "Heart of the Andes," "On the Cordilleras," and "Cotopaxi." Another celebrated work is the "Horse-shoe Fall, Niagara." He visited Jamaica, and afterwards Europe and the Holy Land. Some of his other works are "Damascus," "Jerusalem," "The Parthenon," and "Tropical Scenery."

CHURCH, FREDERICK STUART, American artist; b. Mich. 1841; member of the National Academy, Society of American Artists, and American Water-color Society. He made a specialty of animal and bird life; and also produced satirical work. Among his pictures are "Weirdness," "Mad as March Hares," and "The Sea Princess," in oils; and "Hard Times" and "The Phantoms," in water colors. He exhibited "St. Cecilia" in 1896.

CHURCH, IRVING PORTER, b. Ansonia, Conn., July 22, 1851; graduated at Cornell University, 1873; assistant professor of civil engineering there, 1876-92; and became professor of applied mechanics there, 1892. He published numerous text-books, including *Statics and Dynamics* (1886), *Mechanics of Materials* (1887), *Mechanics of Engineering, Notes and Examples in Mechanics* (1892).

CHURCH, SIR RICHARD, 1784-1873; an Englishman who held the principal command in the Greek war of independence. On the final establishment of the kingdom of Greece, he was made a councilor of state, and afterwards a member of the senate; and was for many years at the head of the army and navy.

CHURCH, SANFORD ELIAS, LL.D., 1815-80; b. N. Y.; bred to the law in which he speedily rose to a prominent position. In 1850 he was elected lieut.-gov. of New York, and was re-elected in 1852; in 1857 he was elected controller, but twice afterwards defeated for the same office. In 1870 he was elected chief justice of the court of appeals, which position he held until his death.

CHURCH-ALE, in England, was an annual festival, held in a church-yard or near a church, at which much ale was used. It is said by some to have celebrated some anniversary, as the dedication of a church, or Easter or Whitsuntide. The profits were used for church repairs. Church-ales are now represented by village fairs, wakes, etc.

CHURCH CALENDAR, a table of the order and series of days, weeks, months, and holy days in the year. The name is derived from *calendæ*, or first days of the Roman month. The earliest now existing which contains the Christian festivals is that of Silvius, 448 A.D. A fragment of a Gothic calendar remains, which probably belongs to the 4th century. The name is applied also to the *fasti* or catalogues for particular churches, of the saints most honored by them, such as bishops, martyrs, etc. At the reformation the German Lutheran church retained the Roman calendar. In 1850, a calendar was published for the evangelical church of Germany. It has been continued annually, and contains much interesting information, in addition to the table of feasts, fasts, etc. The full calendar of the church of England contains 9 columns, giving the golden number, days of the month, the dominical or Sunday letter, the calends, nodes and ides, the daily Scripture lessons, and the holy days of the church, together with some of the Roman festivals which have been retained, not as having any religious value, but because the practice of the courts, the habits of tradesmen, and the times of popular amusements had become interwoven with them. The calendar of the Protestant Episcopal church in the United States retains only the festivals which are referable to a Scriptural origin.

CHURCH CONGRESS, the name of free gatherings of ministers and laymen of the established church of England, annually convened for the discussion of ecclesiastical and religious questions. The first church congress was held in 1861 in Canterbury, and in the following years successively in Oxford, Manchester, Bristol, York, etc. The attendance is usually very large, and comprises many bishops and lower dignitaries. Full reports of the proceedings of each session are published. Such meetings, having the advantage of free interchange of views, but with no claim to ecclesiastical authority, have been found very profitable in this country; and though in the Protestant Episcopal church the sentiment in their favor has not been unanimous, they are winning for themselves an established position through either enthusiastic advocacy or silent consent.

CHURCH DIET, the free gathering of ministers and lay members of German Protestant churches. Such meetings arose in consequence of the revolutionary movements of 1848, which threatened to endanger the influence of the evangelical church upon society. Members of the Lutheran, Reformed, the United Evangelical, with the high church "confessionals" participated in the earlier meetings; but after 1860 only the evangelical parties were represented. Annual reports are published.

CHURCH DISCIPLINE, *Disciplina ecclesiastica*, includes all the means employed by the Christian church, besides the ministration of word and sacraments, to secure on the part of its office-bearers and members a faithful adherence to their profession and a corresponding blamelessness of life. It rests upon the authority of Christ, and at the same time necessarily arises, in some form of it, out of the very constitution of the church as a society. Among the early Christians, it soon assumed forms of great severity towards offenders, especially towards the *lapsed* (q.v.). At a later period, the discipline of the church was chiefly exercised with respect to persons accused of heresy and schism. The penances of the church of Rome have long formed an important part of its discipline, and therewith its *indulgences* (q.v.) are closely connected, as well as its doctrine and rule of *auricular confession* (see CONFESSION). In the Protestant churches, public confession of sins by which public scandal has been given, and submission to public rebuke, are sometimes required. Practices more analogous to those of the primitive church were established in many churches after the reformation, but in general have fallen greatly, or entirely, into disuse. The power of exclusion from the Lord's Supper, and from the rights and privileges of church membership, is, however, generally retained and exercised, until, by profession of repentance, and by reformation of life, the cause of such exclusion is removed; and ministers or other office-bearers are, upon offense given in their doctrine or conduct, suspended from their functions, or altogether deposed from their office. The exercise of C. D. belongs more or less exclusively to a hierarchy, or to the office-bearers assembled in church-courts, or to the members of each congregation, according as the church is Episcopalian, Presbyterian, or independent in its church government. There is an increasing tendency among Christians in general to scrutinize closely the claim of right to exercise C. D., and the limits within which it may be exercised.

CHURCH GOVERNMENT. The Christian church, like every other society, must have a certain constitution and rules according to which its affairs are administered. It is disputed, however, among Christians, how far this constitution has been defined, or these rules prescribed by divine authority, and how far they have been left to the discretion of men. The form of C. G. depends primarily on the idea entertained of the constitution of the church. Congregationalists, or independents (q.v.), accordingly place all C. G. in the hands of the members of the congregation and the office-bearers whom they have elected. This theory of C. G. is maintained by many Baptists and others, who, for various reasons, assume different denominations.—Episcopalians and Presbyterians agree that many congregations are to be united under a common government; but this, according to Presbyterians, is properly carried on by ministers and elders of these congregations meeting for this purpose on a footing of equality; whilst, according to Episcopalians, it is more or less absolutely in the hands of bishops, who are superior to the mere pastors of congregations. See EPISCOPACY and PRESBYTERIANISM.

CHURCH HISTORY or **ECCLESIASTICAL HISTORY**. The history of the Christian religion and church forms one of the most important parts of the general history of mankind, and is intimately connected not only with the political history of the world, but with the history of philosophy, of literature, and of civilization. The sources and authorities are extremely various, and their due appreciation often requires as much judgment as their exploration requires toil. Church history is either general—embracing a view of the affairs of the church in the whole world from the beginning to the present day—or particular, relating to some particular country, or time, or portion of the church. By some authors, it has been treated chiefly with regard to the outward affairs of the church; and by others, with reference to doctrine, morals, and the evidences of spiritual life; whilst others still have devoted their attention chiefly to the forms of worship, the constitution of the church, and other things generally comprehended under the name of ecclesiastical antiquities. All these, of course, have important relations to each other. The earliest writers of church history were in general mere chroniclers, following the order of time; in the great work of the Magdeburg centuriators, a method was adopted, of which there had been previous examples, and which afterwards became frequent, of treating each century separately, the centuries being subdivided according to convenience of subjects; but arrangements less mechanical and arbitrary have been adopted by the most eminent modern authors. With much diversity on minor points, there is a general agreement in dividing the whole history of the church into three great periods: the first, from our Savior to the time of Constantine; the second, from that time to the reformation; and the third, from the reformation to the present day.

The earliest facts of C. H. are to be learned only from the New Testament, after which, however, the epistles and other writings of the apostolic and other primitive fathers afford sources of information, unfortunately very scanty; Hegeppus, who

wrote about the middle of the 2d c., has transmitted to us some very imperfect memoirs of these early times; but the first proper ecclesiastical history is that of Eusebius of Cæsarea (324). This work was continued to the 5th c. by Socrates Scholasticus, Hermias Sozomenus, and Theodoret. Similar compilations were executed by Lactantius, Epiphanius, Hieronymus, Theodoret of Cyrus, Philostorgius, and Zosimus. In the 6th c., the chief ecclesiastical historians are—Theodorus Lector, Evagrius, and Nicephorus Callistus; in the 8th, the venerable Bede and Paul Warnefried; in the 9th, Theophanes Confessor, Claudius of Turin, Haymo of Halberstadt, Scotus Erigena, and Hinkmar of Rheims; in the 12th and 13th, Photius, Simeon Metaphrastes, Theophylact, Matthew Paris, Albert of Strasburg, and Ptolemy of Lucca; in the 15th, Laurentius Valla is the most conspicuous name. Protestant writers were the first to treat C. H. in a critical and scientific manner. This was natural, for their position as apparent schismatics compelled them to vindicate historically the changes which they had wrought in the character of the church. Hence their writings were of an apologetic and polemical cast. The first work of this kind was the *Magdeburg Centuries* (q.v.), published by Matthias Flacius. Special histories of the reformation were composed by Sleidan and Seckendorf. In the 17th c., Calixtus distinguished himself in this department, and after him Thom. Illig, Adam Rechenberg, and Thomasius. The new life that awoke in Germany towards the middle of the 18th c., produced a multitude of church historians, of whom we can only afford to mention Arnold, C. M. Pfaff, Mosheim, Semler, and J. Matth. Schröckh; while in still more recent times, Marheineke, Danz, Neander, Geseler, and Hagenbach have achieved the highest distinction in the same sphere of labor. But others besides the Lutheran divines have rendered valuable services to church history. The reformed church boasts the eminent names of Du Moulin, Joh. Dalläus, Blondel, Hottinger, Spanheim, Turretin, Venema, Jablonski, and recently, D'Aubigné; while among Englishmen, Usher, Pearson, Bingham, Lardner, and recently, Milman and Maurice, have won a distinguished place. Scotland has few names, the chief being Calderwood, Wodrow, M'Crie, and recently Cunningham. In the Roman Catholic church, since the period of the reformation, ecclesiastical historians have rarely manifested a dispassionate and philosophic spirit. They have appeared mainly in the character of defenders of the papacy. The greatest names in C. H. in Catholic France are Tillemont, Bossuet, Bayle, Du Pin, Thomassin, and Fleury. Among the Italians may be mentioned Orsi, Saccharelli, Pallavicini, Guicciardini, and Muratori; and among the Roman Catholics of Germany, Dannenmayr, count Stolberg, Ritter, Hortig, Döllinger, etc.

For the benefit of the English reader, it may be stated that the extensive, profound, and philosophic work of Dr. Augustus Neander has been translated from the original German into English, and is published in 10 vols. by Bohn. See ECCLESIASTICAL HIST.

CHURCHILL, a co. in w. central Nevada, intersected in the n. part by the Central Pacific railroad; 4852 sq.m.; pop. '90, 703. It is watered by the Humboldt, Carson, Walker, and other rivers. Among the minerals are gold, silver, salt, soda, etc. Co. seat, Stillwater.

CHURCHILL, CHARLES, an English poet, now remembered almost as much for his profligacy as his poetry, was b. at Westminster, where his father was a curate, in 1731. He was educated at Westminster school, and in his 17th year made a clandestine marriage. In 1756, he was ordained, and, two years afterwards, succeeded his father as curate of St. John's, Westminster. Soon after his transference here, he fell into habits very ill-becoming his clerical character. In 1761, he published (at his own risk, the booksellers having refused him five guineas for it) *The Rosciad*, a satire on theatrical managers and performers, which displayed much critical acumen, clever sarcasm, and no little humor, and enjoyed such an immense success that C., who on its publication had withheld his name, was soon delighted to avow himself author. In the same year appeared *The Apology*, a bitter satire on some of his critics, which added alike to his purse and his notoriety. He now totally neglected the duties of his office, was a constant attendant at theaters, and altogether led a most dissolute life. His parishioners were scandalized, and his dean remonstrated, whereupon C., to show his utter contempt for the ministerial profession, appeared in a blue coat, gold-laced hat and waistcoat, and large ruffles. He was obliged, however, to resign his preferment, which pecuniary sacrifice was little, as his works brought him considerable sums. He further displayed the complete licentiousness of his nature by separating from his wife, and seducing the daughter of a tradesman in Westminster, and by endeavoring to excuse his vices in a poem called *Night*, on the ground that avowed profligacy was more harmless than profligacy practiced in concealment. The boon-companion of as great a debauchee as himself—Wilkes—he contributed to the pages of the *North Briton*, among other things, *The Prophecy of Famine—A Scots Pastoral*, one of the best of his satires. Among his other works, all more or less satirical, are the *Epistle to Hogarth*; *The Author*; *The Candidate*; *The Ghost*; *Gotham*; *The Duellist*, etc., of which *The Author* is the best. He died Nov. 4, 1764, while on a visit to Wilkes at Boulogne. C.'s thorough profligacy has naturally led to an unjust depreciation of his poetical abilities. See *Poetical Works* by Took (1867), with *Life* by Hannay.

CHURCHILL, JOHN. See MARLBOROUGH.

CHURCHILL, MISSINNIPPI or ENGLISH, **RIVER**, in British North America, rising in Methy lake, and running s.e. through Buffalo and La Crosse lakes, to Hudson's Bay; length about 700 miles.

CHURCHILL, THE RIGHT HON. LORD RANDOLPH HENRY SPENCER, second son of the duke of Marlborough, was born in 1849 and educated at Oxford. In 1874 he married Miss Jennie Jerome, daughter of Mr. Leonard Jerome, of New York, and in the same year entered the House of Commons as member for Woodstock. For several years he seldom addressed the House, but the Conservative party's defeat in 1880 seems to have roused Lord Randolph to exert himself as a leader. In the years that immediately followed he distinguished himself as a ready, audacious, and unconventional debater, attracting particular attention by his free criticism of Mr. Gladstone, who was then premier, and forming with Mr. Gorst and Sir H. D. Wolff what was known as the Fourth Party. He succeeded so far in attaining prominence that he became successively chairman of the Conservative Union (1884), Secretary of State for India (1885), leader of the House of Commons and Chancellor of the Exchequer (1886). This post he resigned in the same year. Lord Randolph represented what is known as the "Tory Democracy" (q.v.). Much of his political success was recognized as due to the energy and enthusiasm of his wife, who has been very prominent in the councils of the Primrose League (q.v.). He died of paresis, Jan. 24, 1895.

CHURCH MUSIC. See ANTHEM, ANTIPHONY, CHORALE, HYMNS, MASS, PLAIN SONG.

CHURCHING OF WOMEN, a religious usage prevailing in the Christian church from an early period, of women, on their recovery after child-bearing, going to church to give thanks. It appears to have been borrowed from the Jewish law (Lev. xii. 6). In the church of the early ages, it was accompanied with various rites; and in the church of Rome and Greek church, it is imperative. In the church of England, also, a service for the C. of W. finds a place in the liturgy.

CHURCH OF ENGLAND. See ENGLAND, CHURCH OF.

CHURCH OF ENGLAND, FREE. See REFORMED EPISCOPAL CHURCH.

CHURCH OF GOD. See WINEBRENNERIAN.

CHURCH OF SCOTLAND. See SCOTLAND, CHURCH OF.

CHURCH RATES, in England, a tax or assessment laid on the parishioners and occupiers of land within a parish, by a majority of their own body in vestry assembled, for the purpose of upholding and repairing the fabric of the church and the belfry, the bells, seats, and ornaments, the churchyard fence, and the expenses (other than those of maintaining the minister) incident to the celebration of divine service. The parishioners are convened for this purpose by the church-wardens (q.v.). The chancel (q.v.) being regarded as belonging peculiarly to the clergy, the expense of maintaining it is laid on the rector or vicar, though custom frequently lays this burden also on the parishioners, as in London and elsewhere.

The C. R. were anciently a charge on the tithes of the parish, which were divided into three portions: one for the structure of the church, one for the poor, and the third for the ministers of the church. This distribution is said to have originated with pope Gregory, who enjoined St. Augustine thus to divide such voluntary offerings as might be made to his missionary church in England. A canon of archbishop Ælfrie in 970, and an act of the Wittenagemote in 1014, in Ethelred's time, have been quoted in proof of the recognition of this rule by our Saxon fathers. It seems to have been their custom, also, to devote to the repair of each church a portion of the fines paid for offenses committed within the district attached to it; and every bishop was bound to contribute to the repair of his own church from his own means. A third of the tithes thus originally devoted to the repairs of churches, continued to be applied to that purpose under the Normans, down to the middle of the 13th c.; and the manner in which this burden came to be shifted to the parishioners, has been a subject of much discussion among legal antiquaries. Lord, then sir John, Campbell, who published a pamphlet on the subject in 1837, is of opinion that the contributions of the parishioners were at first purely voluntary, and that the custom growing, it at last assumed the form of an obligation, and was enforced by ecclesiastical censures. The care of the fabric of the church, and the due administration of its offices, are laid upon the ministers and the church-wardens conjointly, and the latter may be proceeded against by citation, in the ecclesiastical courts, should they neglect these duties. But there is no legal mode of compelling the parishioners as a body to provide the rate; and this circumstance has occasioned much difficulty in imposing the tax in parishes in which dissent is prevalent, and led to many churches falling into a partially ruinous condition. The proper criterion for the amount of C. R. is a valuation of the property within the parish, grounded on the rent that a tenant would be willing to pay for it. Glebe land, the possessions of the crown in the actual occupation of the sovereign, and places of public worship, are not liable for C. R.; but there is no other exception as regards immovable property, and in some parishes, custom even extends it to stock in trade. It has been often decided in the courts that a retrospective church-rate—i.e., a rate for expenses previously incurred—cannot be validly imposed. Much difficulty has been experienced in recovering the rates imposed by the parish on individuals refusing to pay. Previous to 53 Geo. III. c. 127, the only mode was by suit in the ecclesiastical court. That statute, however, in all cases under £10,

empowered the justices of the peace of the county where the church was situated, on complaint of the church-wardens, to inquire into the merits of the case, and order payment. Against the decision of the justices, an appeal lies to the quarter-sessions. In 1868, an end was put to all parochial contentions by enacting that no suit or proceeding should thereafter be allowed in any court to enforce or compel payment of a church-rate, except where a local act authorized this rate. But except so far as related to the compulsory payment of these rates, the church-wardens might, as before, make, assess, receive, and deal with such rates. In each district parish, the inhabitants may treat their own church as if it were their parish church, and make and receive rates for the repair of the same. A body of trustees may now be appointed in each parish to receive contributions for ecclesiastical purposes in the parish.

CHURCH-WARDENS, in England, are ecclesiastical officers, elected sometimes by the parishioners and minister jointly, sometimes by the minister alone, and sometimes by the parishioners alone, for the purpose of protecting the edifice of the church, superintending the celebration of public worship, and to form and execute other parochial regulations. They are generally two in number. See **CHURCH RATES**, **PARISH**, **VESTRY**. In the Prot. Epis. church of the U. S., wardens are annually elected by each parish in Easter week; their duties, which are regulated by diocesan and not by general canons, being virtually the same as those of the corresponding English officials, omitting such as relate to a church established by the state.

CHURCH-YARD. See **BURIAL**, **CEMETERY**.

CHURN, a machine for agitating milk or cream for the production of butter. The principle of the operation is considered in the article on **BUTTER**. Of the great variety of forms that have been given to the machine, it is very difficult to determine which deserves the preference. It is obvious that the more thorough and uniform the agitation, the more completely will the butter be separated from the milk. The consistency and color of the butter are also elements in judging of the relative merits of churns. The temperature of the air and the milk affect the butter in these respects. During summer, that of the milk should not exceed 62°, and in very hot weather may be under 60°. During cold weather, the milk should be about 2° higher when put into the churn. The speed at which the operation is performed also influences the result. Trials instituted to test the relative merits of churns have failed to settle which is the best form for actual use in the dairy; for the same machine under different conditions does not always yield the same result. The oldest form is the upright or *plunge* churn. There is a general prejudice in favor of this form of C., on the ground that the butter is more completely separated and of better quality. Its great defect is that the operation, being generally performed by hand, is fatiguing. Recent improvements have chiefly aimed at ease in working, and a saving of time. The original *barrel* C., with a rotatory motion, like a grindstone, which motion was reversed every few rounds, has fallen from its once high repute into comparative neglect. An improvement on the barrel C. was the making of the barrel stationary, the milk being agitated by internal apparatus fixed on a horizontal spindle which is turned by a winch handle. Barrel churns, sometimes of monster size, are generally used in large dairies in Holland. For small or moderate-sized dairies, perhaps the most suitable is the *box* C., consisting of a cubical or oblong box, of birch or plane tree, having the agitators fixed on a horizontal spindle. Churns on a centrifugal action have also been successfully used, particularly in Sweden. More recently, churns of a barrel form, with an oscillating motion like a child's cradle, have been introduced, but without any decisively superior results.

To all forms of churns, power other than manual can be and is applied. In some parts of the continent of Europe, and in America, the dog is employed in churning by means of a contrivance like a squirrel's box. Horse-power is in very general use in large dairies in Great Britain. See *illus.*, **THE DAIRY**, vol. IV.

CHURUS. See **HEMP**.

CHURUBUSCO, a village 6 m. s. of the city of Mexico, on the river Churubusco, connected with the capital by an elevated paved causeway. In the village is the large convent of San Pablo. In the war between the United States and Mexico, Santa Anna made a stand here, Aug. 20, 1847, but the Americans under Gen. Scott were victorious after a sharp action. On the same day occurred the battle of Contreras, and three weeks after that of Chapultepec, and the capture of the Mexican capital.

CHUSAN, an island on the e. coast of China, 40 m. n.e. from Ningpo, in 30° 40' n. lat., and 121° 48' e. long., of an oblong shape, and about 50 m. in circumference. It is mountainous; but has many fertile valleys, with a plentiful supply of water, and is very carefully cultivated by the hardy and independent people by whom it is inhabited. Mr. Fortune was struck with the richness of its flora. Azaleas clothe the mountains; clematises, roses, and honeysuckles grow in great luxuriance. The camphor and tallow tree, and many varieties of bamboo, are found in the valleys. Tea is cultivated to some extent on the hill-sides. For three fourths of the year, the climate is temperate. June, July, and Aug. are the hot months. Pop. about 200,000.

CHUSAN ISLANDS, a group of islands scattered round the one described above. The most remarkable of these is the sacred island of Pu-tu, lying e. from Chusan. It is covered with Buddhist temples, pagodas, and monasteries, which latter are inhabited by

a great number of Bonzes, as the Chinese priests are called. The island is devoted exclusively to religious purposes, and no layman is allowed to reside upon it.

CHUTIA, or **CHOTÁ, NÁGPUR**, a division of British India under the lieutenant-governor of Bengal, comprising the districts of Hazáribágh, Lohárdágá, Mánbhúm, and Sínhbhúm, and the seven tributary states which constitute the south-west frontier agency, between 21° and 25° n., and 82° and 87° e.; 43,901 sq.m.; pop. '81, 4,225,989, residing in 25,766 villages and 725,287 houses. In 1872 there were 2,567,292 Hindus, 169,006 Mohammedans, 15,798 Christians, and 1,703,475 of no religion specified. The last-named class consists mostly of remnants of tribes driven from the plains by the Hindus. There are in the division only six towns of more than 5,000 inhabitants. The chief productions are rice, corn, pulse, potatoes, and oil-seeds. A little tea is grown in two of the districts. The climate is dry and healthy.

CHUTIA, or **CHOTÁ, NÁGPUR TRIBUTARY STATES** (of India), seven in number, viz.: Sirguja, Udaipur, Jashpur, Gangpur, Bonái, Koriá, and Chang Bhakár, now under the political superintendence of the commissioner of Chutiá Nagpur, and forming the south-west frontier agency. The states are mountainous, thinly cultivated, and inhabited for the most part by wild aboriginal tribes; area, 15,419 sq.m.; population, 405,980. There are no towns, and only three villages of more than 1000 inhabitants.

CHUT'NEE, or **CHUT'NY**, an East Indian condiment, very largely used in India, and to a considerable and increasing extent in Great Britain. Indian C. is a compound of mangoes, chillies or capsicum (q.v.), and lime-juice, with some portion of other native fruits, such as tamarinds, etc., the flavor being heightened by garlic. It is sometimes manufactured for sale in England, but not in any quantity. Families occasionally make it for their own use, and employ the following ingredients: Chillies, 1 to 1½ lbs.; apples, 1 lb.; red tamarinds, 2 lbs.; sugar-candy, 1 lb.; fresh ginger-root, 1½ lbs.; garlic, ¼ to ½ lb.; sultana raisins, 1½ lbs.; fine salt, 1 lb.; distilled vinegar, 5 bottles. The chillies are to be soaked for an hour in the vinegar, and the whole ground with a stone and muller to a paste.

CHWALYNSK', a t. of Russia on the Volga; pop., 14,262. It is a river port, and has important manufactures.

CHYLE. The food undergoes various changes in the alimentary canal, which will be fully noticed in the article on **DIGESTION**. One of these changes is its conversion in the stomach into a pulpy mass termed *chyme*. The chyme, which passes onward into the small intestine, is acted upon by the bile, pancreatic fluid, and intestinal juice, and through their influences is separated into the *chyle*, which is absorbed or sucked up by the lacteals (q.v.) and into matters unfit for nutrition, which ultimately find their way out of the system by the intestinal canal. The mode in which this nutritious C. is taken up by vessels distributed over the small intestines, and the changes which it undergoes before it is converted into true blood, are described in the articles **LACTEALS**, **THORACIC DUCT**, and **NUTRITION**. We shall here merely notice its leading physical and chemical properties. When obtained from the thoracic duct of an animal that has been killed while the process of digestion was going on (especially if it had taken fatty food), the C. is a white, milky-looking, or yellowish fluid, with a faintly alkaline reaction. Like the blood, it coagulates in about ten minutes after its abstraction from the body of the animal; and in about three hours a small but distinct gelatinous clot is separated from the serous fluid of the chyle.

On examining C. under the microscope, we find that it contains enormous numbers of minute molecules (probably consisting of fat), together with nucleated cells, which are termed the chyle-corpuscles, and are apparently identical with the white or colorless blood-cells. The chemical constituents of C. are much the same as those of blood; fibrin, albumen, fat, extractive matters, and salts being the most important.

CHYLIFEROUS SYSTEM. See **LACTEALS** and **THORACIC DUCT**.

CHYME. See **CHYLE** and **DIGESTION**.

CHYTREÛS, **DAVID**, 1530-1600; an eminent Lutheran theologian. He studied at Tübingen and Wittenberg, and was a pupil of Melancthon. His learning and talents gave him high position, and he was employed by Maximilian II. to arrange ecclesiastical affairs in Austria. He was principal author of the statutes of Helmstadt, and one of the authors of the *Formula of Concord*. He left a number of important theological works.

CIALDINI, **ENRICO**, was b. at Castel Vetro, Modena, Aug. 8, 1811. Designed for the medical profession, he studied at Parma. When the abortive insurrection of 1831 broke out in the duchies, C. joined the volunteers of Reggio; and on the capitulation of Ancona, embarked for France, where he resumed his medical studies. The struggles against absolutism in the Iberian peninsula opened anew the career of arms to the Italian exiles. He joined the legion raised by Dom Pedro in France against the Miguelists, when his great personal courage soon secured his promotion; and the unanimous vote of his comrades pronounced him the worthiest man to receive the order of the tower and sword decreed by the government to his company. After the capitulation of Evora, C. joined (Oct. 22, 1835) the legion of Oporto, formed under Borso di Carminati for ser-

vice in Spain. In this force, C. gained further honors. In 1843, he followed Narvaez in his march against Madrid; was made by him col. of the regiment of St. Ferdinand; and afterwards employed in organizing the civil guard on the model of the French *gendarmérie*. He was in this force when Charles Albert headed the Italian rising in 1848, when he hurried to Italy, and in the struggle which ensued he received a dangerous wound, and fell into the hands of the Austrians. On his release, he was employed by the Sardinian government to reduce to regular discipline the unruly volunteers from the duchies. He succeeded at last, and fought well at the head of his new regiment in the brief campaign of 1849. During the ten years that elapsed from the defeat of Novara to the renewal of the war in 1859, C. was actively employed. In the Crimea, he commanded the third division of the Sardinian contingent; and on his return was appointed inspector-gen. of bersaglieri and aide-de-camp to the king—a rare distinction for a man of plebeian origin. He was intrusted by Cavour with the formation of the famous Cacciatori delle Alpi, placed under the command of Garibaldi after the declaration of war, and co-operated actively with them at the head of the fourth division. The victory at Palestro was his chief exploit, the further progress of the Italians being stopped by the peace of Villafranca. In 1860, he defeated the papal army under gen. Lamoricière, at Castelfidardo. Diplomacy delayed the fall of Gaeta till Feb. 13, 1861, when it yielded to C. after a vigorous bombardment, as did the citadel of Messina shortly afterwards. Turin erected a statue to C. (*vincitore sempre*), and Reggio elected him deputy in April. For a few months he was governor of Naples. He had to act against Garibaldi in the second Sicilian expedition. When the army of Italy was reorganized in 1863, C. was appointed to one of the chief commands. Senator in March, 1864, he signaled himself by his brilliant speech in favor of the transfer of the capital (Dec., 1864). In the war of 1866, the advice of La Marmora was followed, and the defeat of Custoza was the result. C. was appointed chief of the staff on the resignation of La Marmora. In 1867, C. was intrusted by the king with the formation of a new ministry, but failed; he was also made commander-in-chief of the troops in central Italy. In 1870 he was engaged in the annexation of the papal states; and in 1876-79 and 1880-81 he was sent ambassador to France. He d. in 1892.

CIBA'O, a range of mountains in the middle of the island of Hayti, about 90 m. long, and having summits more than 7000 feet high. Gold has been found in these mountains.

CIBBER, CAIUS GABRIEL, 1630-1700; a sculptor, b. in Holstein, who was engaged to execute the *bassi rilievi* on the pedestal of the London monument, to commemorate the great fire of 1666. He made also the two figures representing "Madness" which once adorned the gate of the old Bethlehem hospital. He built the Danish church in London at his own expense.

CIBBER, COLLEY, was b. on the 6th Nov., 1671, in London. He was sent to the free school at Grantham, in Lincolnshire, in 1682. Five years thereafter, he returned to London, and in 1688 was a volunteer in the forces raised by the earl of Devonshire in support of the Prince of Orange. He afterwards conceived a passion for the stage, and after performing gratuitously for several months, he succeeded in obtaining an engagement at 10s. per week, which was raised to 15s.; and on the commendation of Congreve, who had witnessed his performance of lord Touchwood, five additional shillings per week were added. Incited by this magnificent success, he, at the age of 22, married Miss Shore, to the great rage of her father, who revenged himself by spending the greater portion of his fortune in the erection of a retreat on the banks of the Thames. After marriage, C., discovering that 20s. per week was a somewhat insufficient income for an elegant gentleman and an elegant gentleman's wife, was induced to add thereto by the writing of comedies, some of which were remarkably successful. In 1711, he became one of the patentees in the management of Drury Lane, and remained in connection with that theater till 1730; when, on being appointed poet-laureate, he sold his interest in the business. He was, however, sometimes tempted back to the stage by an offer of 50 guineas a night. C. wrote and adapted many plays, but as an author he is best known by his *Apology*. He died suddenly on the 12th Dec., 1757.

CIBBER, SUSANNAH MARIA, 1714-66; wife of Theophilus, and daughter-in-law of the dramatist Colley Cibber. Her brother, Dr. Arne, instructed her in music, in which first she appeared publicly; but after her marriage she preferred tragedy. She is the actress of whom Garrick exclaimed on hearing of her death, "Then tragedy has expired with her!"

CIB'OL. See ONION.

CIBORIUM, a chalice, pyx, or cup, usually of gold or silver, with a cover surmounted by a cross. It is used in the Roman Catholic service to contain the host, or consecrated wafer, in the service of the mass. Ciborium is also the name of a canopy on the altar, supported by four columns, to which the cup, in the shape of a dove, was attached by chains. This especial cup contained the wafer for the communion of the sick. See *illus.*, CEREMONIES, vol. III.

CIBRA RIO, LUIGI, an Italian historian and politician, was b. at Turin, 23d Feb., 1802. He studied at the university of that city, where he took his degree in 1824 as

doctor of laws. Devoted to historical investigations, he secured a reputation in this important department, at a very early period. In 1825 appeared his *Notizie sulla Storia dei Principi di Savoia*; in 1826, his *Notizie di Paolo Simone de Belli*; and in 1827, his *Delle Storie di Chieri Libri IV*. King Charles Albert—with whom he was always a great favorite—frequently employed him in diplomatic service, and in 1848, when Italy rose against the Austrians, appointed C. extraordinary royal commissioner at Venice. During the same year, he was created a senator of the kingdom. When Charles Albert—after the unfortunate issue of the war—went to live in voluntary exile at Oporto, C. was sent by the Sardinian senate to induce him to return. He wrote an account of his unsuccessful mission, entitled *Ricordi d'una Missione in Portogallo al Re Carlo Alberto* (1850). During his public career, however, C. did not neglect his early and favorite pursuits. In 1839, he published his *Della Economia Politica del Medio Evo*; in 1840, his *Storia della Monarchia di Savoia*; in 1844, his *Storia e Descrizione della Badia d'Altacomba*; and in 1847, his *Storia di Torino*. But the new life and energy which Sardinia began to manifest under Victor Emmanuel had its claims on his public usefulness. In 1850, he was appointed superintendent-general of customs, and while occupying this office introduced several important reforms. Subsequently he was intrusted with full powers to negotiate a treaty of commerce with France, in which he distinguished himself notably by his advocacy of the principles of free trade. In 1852, he was made minister of public instruction, and, in 1855, minister of foreign affairs. When Cavour took this department into his own hands, C. became first secretary of the king. In 1857, he was appointed president of the telegraphic congress of Turin. In 1860, C. again made a most successful appearance as an author, in his *Operette Varie* (Torino), and in his *Jacopo Valperga di Masino, Cancelliere di Savoya*. He died at Salò, in the province of Brescia, 1st Oct., 1870.

CICADA, a genus of insects of the order *hemiptera*, sub-order *homoptera*, remarkable for the sounds which they emit, the loudness of which is very extraordinary, when considered with reference to the size of the creatures producing them. The largest European species are only about an inch long. The elytræ, or wing-covers, of the cicadæ are almost always transparent and veined. They dwell on shrubs and trees, of which they suck the juices. The male insects alone possess the organs of sound perfectly developed. These are in no way connected with the mouth or throat, but may be described as a musical apparatus on the under side of the abdomen. This apparatus is very complicated, consisting of a set of membranes and fibers connected with powerful muscles. The sound can be produced even after the insect has been long dead, by pulling the fibers, and letting them escape. Cicadas are most common in tropical and warm temperate regions, and are scarcely known in Britain, although one or two species have been found in the s. of England. The ancients regarded the sounds of these insects as types of music and eloquence. In some countries they bear names which signify that sleep is banished by their din. The sounds produced by some of the South American species, which are much larger than the European, are loud enough to be heard at the distance of a mile, and have been likened to the sound of a razor-grinder at work. The Greek name of the C. is *tettix*, often erroneously translated grasshopper. These insects have indeed no resemblance to grasshoppers, and no power of leaping. C. is the Latin name. The modern Italian is *cicale*, the French *cigale*. Byron speaks of the "shrill cicadas." See *illus.*, INSECTS, vol. VIII.

CICATRIZATION (Lat. *cicatrix*, a scar), the process of healing or skinning over of an ulcer or broken surface in the skin or in a mucous membrane, by which a fibrous material, of a dense resisting character, is substituted for the lost texture. The new tissue, in such a case, is called the cicatrix, and usually resembles, to a considerable extent, the structure which it replaces; it is, however, less elastic, and from its shrinking in volume, sometimes produces an appearance of puckering. The glands and other special structures of the original tissue are wanting in the cicatrix, which, however, performs perfectly well, in most instances, the office of protection to the parts below the surface. See INFLAMMATION and ULCERATION.

CICELY, *Myrrhis*, a genus of umbelliferous plants, nearly allied to chervil, of which one species, sweet C. (*M. odorata*), is common in the central and southern parts of Europe, and in similar climates in Asia, but in Britain is so generally found near human habitations that it appears probably to have been introduced. It is sometimes called *sweet chervil*, and in Scotland, *myrrh*. It is a branching perennial, 2 ft. high or upwards, with large triply pinnate leaves and pinnatifid leaflets, somewhat downy beneath; the fruit remarkable for its large size, and, as well as the whole plant, powerfully fragrant, the smell resembling that of anise. The seeds, roots, and young leaves are used in Germany and other countries in soups, etc. The plant was formerly much in use as a medicinal aromatic.

— **CICER**. See CHICK PEA.

CICERO, MARCUS TULLIUS, the greatest orator of Rome, and one of the most illustrious of her statesmen and men of letters, was b. at Arpinum, on the 3d of Jan., in the year 106 B.C. He belonged to an ancient family, of the equestrian order, and possessed of considerable influence in his native district. His father, himself a man of

culture, and desirous that his son should acquire an eminent position in the state, removed him at an early age to Rome, where, under the direction of the orator Crassus, he was instructed in the language and literature of Greece, and in all the other branches of a polite education. In his sixteenth year he assumed the manly gown, and was introduced to the public life of a Roman citizen. He now acquired a knowledge of law, and underwent a complete course of discipline in oratory. At the same time, he studied philosophy under three successive preceptors, of the Epicurean, Academic, and Stoic schools, and neglected no mental exercise, however arduous, which might conduce to his future eminence; being thus early of the opinion which he afterwards maintained in his treatise *De Oratore*, that an orator should possess almost universal knowledge. With the exception of a brief campaign under Sulla, in the social war, he passed his time in these preliminary studies until his 26th year, when he began to plead in public. In one of his earliest causes, he distinguished himself by defending the rights of Roscius, a private citizen, against one of the favorites of Sulla, who was then dictator. Soon after, for the benefit of his health, and in order to his improvement in elocution, he traveled to the chief seats of learning in Greece and Asia; and, on his return, was regarded as second to no orator at the Roman bar. Having been elected quaestor (76 B.C.), he was appointed by lot to a government in Sicily, a post which he filled with great ability, and to the entire satisfaction of those whom he governed. Some years after his return, he laid the Sicilians under still greater obligations by his successful prosecution of their praetor, Verres, against whom he prepared no less than six orations, although the first had the effect of disheartening the accused so effectually, that he voluntarily retired into exile. Passing, at short intervals, through the offices of aedile (69 B.C.) and praetor (66 B.C.), he was at length elected, by an overwhelming majority, to the consulship. His tenure of office was rendered memorable by the conspiracy of Catiline, which he frustrated with admirable skill and promptitude. See CATILINA. The highest praises were showered upon C.; he was hailed by Cato and Catulus as the "father of his country;" and public thanksgivings in his name were voted to the gods. But his popularity did not last long after the expiry of his consulship. His enemies charged him with a public crime, in having put the conspiring nobles to death without a formal trial, and he found it necessary to leave Rome, and went to reside in Thessalonica (58 B.C.). A formal edict of banishment was pronounced against him, but he was recalled from exile in about 16 months, and on his return to Rome was received with great enthusiasm. His recovered dignity, however, soon excited the envy of the honorable party in the senate, with whom he had desired to make common cause; while Pompey and Caesar, the greatest powers in the state, and from whose enmity he had most to dread, courted his alliance and co-operation. Thus, while preserving an appearance of independence, he was betrayed into many actions which he could not but regard as ignominious, and which, by increasing the power of the triumvirs, led indirectly to the ruin of the republic. A remarkable exception to this servile conduct is to be found in his assisting Milo when suing for the consulship, and defending him, against the wish of Pompey, and in spite of the hostile feeling of the populace, after he had slain Clodius in an accidental encounter. During this period he composed his works, *De Oratore*, *De Republica*, and *De Legibus*. After a year's admirable administration of the province of Cilicia (51 to 50 B.C.), he returned to Italy on the eve of the civil war. With the convictions which he avowed, there was but one course which it would have been honorable for him to pursue—to enlist himself, at all hazards, on the side of Pompey and the republic. But instead of this he hesitated, balanced the claims of duty and of interest, blamed Pompey for his want of preparation, and criticised the plan of his campaign. At length he joined the army of the senate, but, after the battle of Pharsalia, abruptly quitted his friends, and resolved to throw himself upon the generosity of the conqueror. After nine months' miserable suspense at Brundisium, he was kindly received by Caesar, whom he followed to Rome. During the years which ensued, he remained in comparative retirement, composing his principal works in philosophy and rhetoric, including those entitled *Orator*; *Hortensius*; *De Finibus*; *Tusculanæ Disputationes*; *De Natura Deorum*; *De Senectute*; *De Amicitia*; and *De Officiis*. On the death of Caesar, he was disposed to unite his interests with those of Brutus and the other conspirators, but was restrained by dictates of prudence. In the commotions which followed, he espoused the cause of Octavianus, and gave utterance to his celebrated philippics against Antony. These orations were the occasion of his death. When Octavianus and Lepidus joined with Antony in a triumvirate, C. was among the proscribed; and his life was relentlessly sought. The soldiers of Antony overtook him while his attendants were bearing him, now old, and in an infirm state of health, from his Formian villa to Caieta, where he intended to embark. He met his death with greater fortitude than he had supported many of the untoward incidents of his life. Desiring his attendants to forbear resistance, he stretched forward in the litter, and offered his neck to the sword of his executioners. He died in the 63d year of his age, on the 7th Dec., 43 B.C.

The character of C. is one which it is not difficult to estimate. Really a lover of virtue, no one could follow in her footsteps with greater dignity when attended by the popular applause. But he was weak enough to yield to the depraved spirit of his times, and to act according to his convictions only when they were not evidently discordant with his private interests. Few men, possessing such talents, have been so

utterly devoid of anything approaching to heroism. As a statesman, it would be unjust to deny his legislative abilities; but he was generally deficient in courage and resolution. He was one of the greatest masters of rhetoric that have ever lived. His orations were the result of consummate art, combined with unwearied industry, and survive as characteristic memorials of a time when eloquence, far more than at present, was a power which bent the verdicts of judicial tribunals, and influenced the decrees of the state. In philosophy, he does not rank with the original thinkers of antiquity; nor, in truth, did he aspire to do so. His writings on speculative subjects are chiefly valuable on account of the noble and generous sentiments which they contain, and as reflecting the varied thought of the different schools. The best edition of his correspondence is that of Tyrrrell and Purser (1886—); of his orations, that of Long (1862); of the philosophy by Schiche (1884), and of the fragments, that of Müller (1879). See the life of Cicero by Forsyth (1864), by Trollope (1880), and Boissier, *Cicéron et ses Amis* (4th ed. 1888).

CICERO'NÉ (from Cicero, the orator or speaker), a guide, usually for the purpose of showing the curiosities and works of art in a town to strangers. Cicerónés are of all degrees, from distinguished archæologists, who undertake the office as a favor, to the humble *laquais de place*, who, though quite indispensable on a first arrival, is too often both incompetent and dishonest.

CICHO'RIMUM. See CHICORY and ENDIVE.

CICINDELA, a genus of insects of the order *coleoptera*, section *pentamera*, the type of a large family, *cicindelidæ*. This family is nearly allied to *carabidæ*, and the insects belonging to it are among the most voracious of those beetles which, both in their perfect and larvæ state, prey on other insects. They have a strong head, with projecting toothed mandibles, and are particularly distinguished by a sort of hook or nail, which is articulated by its base to each of the lower jaws or maxillæ. They are more abundant in tropical than in cold countries; a few species, none of them large, are found in Britain. The head of the larvæ is large, concave above, and the back furnished with two remarkable hooked spines, which are said to be used as anchors to fix it at any part it chooses of its burrow in the earth; whilst the soil which it excavates is carried to the mouth of the burrow in a sort of natural basket formed of the concave back of the head and the recurved mandibles. The larvæ lies in wait in its burrow, its head just level with the ground, till its prey comes within reach, upon which it suddenly rushes. —*C. campestris*, a green species with whitish spots, is common in most parts of Britain.

CICISBE'O is the name given in Italy to the professed gallant or constant attendant upon a married lady. In the higher ranks of Italian society, it was at one time considered unfashionable for the husband to associate with his wife anywhere except in his own house. In society, or at public places of amusement, the wife was accompanied by her C., who attended at her toilet to receive her commands for the day. This custom, which was once universal, and which naturally gave rise to much scandal, has now almost disappeared. C. is synonymous with *caballero servente*.

CICOGNA'RA, LEOPOLDO, Count da, 1767-1834; an archæologist and art-critic of Ferrara. He visited all the noted cities of southern Europe, studying them with the eye of an archæologist and connoisseur. Napoleon found him engaged in politics and a member of the legislative body of Modena. In 1808, C. was made president of the Academy of Fine Arts in Venice. In 1813-18 he produced his great work on the history of art, designed to complete the labors of Winckelmann and d'Agincourt.

CICO'NIA. See STORK.

CICU'TA. See HEMLOCK.

CID'ARIS, a genus of *echinidæ* (q.v.), or sea-urchins, closely allied to the genus *echinus* itself, and included along with it in a family or tribe called *cidarites*, in which the mouth and anus are opposite to each other—the mouth below, and the anus above. Only one species, *C. papillata*, has been found in the British seas, and that only on the coasts of Zetland. The Zetlanders call it the *piper*, from a resemblance which they trace in its globe and spines to a bagpipe. They say that it is sometimes found with spines a foot long. The markings of the shell and spine, are extremely beautiful. See *illus.*, OOLITE GROUP, vol. X.

CID CAMPÊADOR is the name given in histories, traditions, and songs to the most celebrated of Spain's national heroes. There is so much of the mythical in the history of this personage, that hypercritical writers, such as Masdea, have doubted his existence; but recent researches, more particularly those of Dozy, and the investigation of newly discovered Arabic sources, have succeeded in separating the historical from the romantic. See Dozy's *Récherches sur l'Histoire Politique et Littéraire de l'Espagne pendant le moyen âge* (Leyden, 1849). The following is the result of these inquiries: Rodrigo Ruy Diaz (Roderic the son of Diego) was descended from one of the proudest families of Castile. His name first appears in a document written in 1064, during the reign of Ferdinand of Leon. Under Sancho II., son of Ferdinand, he became standard-bearer and commander of the royal troops. In a war between the two brothers, Sancho

II. and Alfonso VI. of Leon, it was a stratagem of Roderic's—which, according to modern notions, was anything but honorable—that secured the victory of Sancho at Llantada (1068) over his brother, who was forced to seek refuge with the Moorish king of Toledo. He appears at this time to have already been called the *campeador*, a word supposed to answer to our champion.

Upon the assassination of his friend and patron, king Sancho, he required the next heir, don Alonzo, to clear himself by oath of any participation in his brother's murder, ere the nobles of Leon and Castile should do homage to him. By this act, he incurred the new monarch's enmity; an enmity which, however, the king's policy concealed in the hour of danger, and he even consented to Roderic's marriage with his cousin Ximena—daughter of Diego, duke of Asturia. But when the king thought the services of Roderic no longer necessary to his own safety, he lent a willing ear to the latter's personal enemies, and banished him in 1081. Roderic then joined the Moorish kings of Saragossa, in whose service he fought against both Moslems and Christians. It was probably during this exile that he was first called the *Cid* or *Sid*, an Arabic title which means lord. He frequently defeated the king of Aragon and the count of Barcelona, the latter of whom, Berenguer Ramon II., he took prisoner.

He was again reconciled to the king, but only for a short time, when he was condemned to a second exile. In order to support his family and numerous followers, he now saw himself forced to carry his sword against the Moors, over whom he gained a victory, and established himself as sovereign or lord of Valencia (1094). He retained possession of Valencia five years, during which time he took many neighboring fortresses. He died of grief in 1099, on learning that his relative and comrade in arms, Alvar Fañez, had been vanquished by the Moors, and that the army which he had sent to his assistance had been defeated near Alcira. After the *Cid*'s death, his widow held Valencia till 1102, when she was obliged to capitulate to the Almoravides, and fly to Castile, where she died in 1104. Her remains were placed by those of her lord in the monastery of San Pedro de Cadeña. The *Cid* had a son, who was slain by the Moors in a battle near Consuegra. He also left behind him two daughters, one of whom was married to the count of Barcelona; the other to an infant of Navarre, through whom the kings of Spain and many royal houses of Europe claim kindred with "*Mio Cid el Campeador*." Relics of the "Blessed *Cid*," as he is still called in Spain, such as his sword, shield, banner, and drinking-cup, are still held in great reverence by the populace. The numerous *Cid romances* that were first published in the 16th c., contain the most romantic improbabilities concerning the life and deeds of the *Cid*. See *Silva de Varios Romances* (1550), and *Romancero General* (1604). These romances were taken from the ancient *cantares* (national songs) and *poemas*, most of which are entirely lost. The most important of modern works on this subject, besides that of Dozy above mentioned, are Huber's *Geschichte des Cid*, etc. (Bremen, 1829), and Southey's fascinating *Chronicle of the Cid* (Lond. 1808). The former of these is, however, the more valuable in a historical point of view. See also Willemaers, *Le Cid* (Bruss. 1873).

CIDER is the fermented juice of apples, and is extensively prepared in Gloucestershire and other parts of England, in Ireland, in the northern districts of France, and in North America. In Normandy, a vast number of varieties of acid or bitter-apples are grown for the preparation of cider. The apples are first bruised in a circular stone-trough or *chase*, by a similarly shaped stone or *runner*, which revolves by machinery in the interior of the trough. The pulp so obtained is placed in sieve-bags made of hair-cloth or reed-straw, and subjected to pressure, which yields a dark-colored, sweet liquid, and leaves in the bag a somewhat dry residue, consisting of the pips, skin, and other fibrous parts of the apple. The apple-juice passes first into a shallow tub or *trín*, and is almost immediately placed in casks in a cool place, when fermentation begins, part of the sugar is converted into alcohol, and in a few days, a clear liquid is obtained, which can easily be racked off from sedimentary matter. *C.* is largely used in America as a beverage, and is very palatable and refreshing. It contains from $5\frac{1}{2}$ to 9 per cent. of alcohol, and is therefore intoxicating when drunk in quantity. It does not possess the tonic and nourishing properties, however, of bitter beer. *C.* quickly turns sour, becoming *hard C.*, owing to the development of lactic acid. See **APPLE-JACK**.

CIENFUEGOS, a city in Cuba, on the s. coast of the island, on the bay of Jagua, 120 m. s.e. of Havana; pop. '92, 27,430. It has a good harbor, and is one of the best built cities in the island. Railroads give communication with Cardenas and other towns on the n. coast. *C.* was founded in 1813 by a captain-general of that name.

CIGARETTE, is a roll of tobacco enclosed in thin paper. The manufacture is comparatively new in the U. S., as the extensive use of the article is recent here, though long in vogue in some southern countries. The leaves of the tobacco are first stripped, during which process atomizers are used to keep the tobacco at a proper temperature, and to destroy impurities. The leaves are then pressed and mixed in various proportions, according to the brand desired; after which the tobacco is rolled in paper wrappers, usually 3 in. long, 1 in. wide, and pasted with starch. Hydrometers are used in the packing room to denote the proper degree of humidity. The best wrappers are made in Switzerland, of thin rice straw. *C.* smoking is pronounced by physicians to be productive of injury to the heart, especially when the smoke is inhaled. For this reason some states have enacted laws forbidding the sale or presentation of cigarettes to children under fifteen years of age. See **TOBACCO**.

CIGARS. See **TOBACCO.**

CIGOLI, LUDOVICO CARDI DA, an architect and painter of the later Florentine school, which, about the end of the 16th c., developed, in opposition to the languid mannerists of the time, a peculiar *eclectic* style of art. C. was b. at Empoli in 1559. His model was Correggio; but as the latter was deficient in design, and in the scientific knowledge of perspective, C. endeavored to unite these with the warm bright coloring and wonderful chiar-oscuro of Correggio. He was invited by Clement VII. to Rome, where he died in 1613. Among C.'s most famous pictures may be mentioned—"The Healing of the Lame Man" (St. Peter's, Rome), "The Martyrdom of St. Stephen" (Uffizi Gallery, Florence), "Tobias in the Act of Thanking the Angel" (St. Petersburg), and "St. Francis," a favorite subject with C. (Pitti Palace, Florence).

CILIA, (Lat. eyelashes), a term variously employed in botany and zoology to designate fringing hairs or hair-like processes. Thus, the margins or nerves of leaves, petals, etc., are often described as *ciliated* or furnished with cilia. The fine thread-like processes which surround the opening of the fruit of many mosses, are called C.; but these processes, when broader, are denominated teeth. See **EPITHELIUM**.

CILICIA, an ancient division of Asia Minor, now included in the Turkish eyalet of Koniah. The Taurus range, which separated it from Cappadocia, bounded it on the n., the gulf of Issus and the Cilician sea on the s., while the Amanus and Pamphylia bounded it respectively on the e. and west. Lat. 36° to 38° n., long. 32° 10' to 37° 8' e. The eastern portion of C. was fertile in grain, wine, etc.; while the western and more mountainous portion furnished inexhaustible supplies of timber to the ancients. The pass called by the Turks Gölek Bógház is that by which the younger Cyrus passed from Tyana in Cappadocia to Tarsus; and it is also the same by which Alexander the Great entered Cilicia.

In early ages, C. was ruled by its own kings, the dynasty of Syennesis being apparently the most important. The Cilicians were a distinct people in the time of Xenophon; but the Greeks appear to have got a footing after the time of Alexander. The Cilicians were notorious pirates, but having carried on their depredations too close to the shores of Italy, the Roman arms were turned against them, and C. was made a Roman province in Pompey's time.

CIMABUÉ, GIOVANNI, one of the restorers of the art of painting in Italy, which had fallen into neglect during the barbarism of the dark ages, was b. at Florence in 1240. At this time, the fine arts were practiced in Italy chiefly by Byzantines, and had degenerated into a worn-out mechanical conventionalism. C. at first studied under Byzantine masters, and adopted their traditional forms, but gradually excelled his teachers, made innovations on the fixed patterns set before him, and gave life and individuality to his works. Two remarkable pictures of the Madonna by C. are still preserved in Florence—one (chiefly Byzantine in style) in the academy; the other, displaying a more purely original genius, in the church of Santa Maria Novella. It is said that this latter work in the time of C. was admired as a miracle of art, and was carried to the church in a sort of triumphal procession. More remarkable pictures in point of expression or dramatic effect, are found in C.'s frescoes in the church of San Francisco at Assisi. C. died soon after 1300. What strikes one as very wonderful about C.'s pictures, is the accuracy of his naked figures, considering that he had no better professional guides than the Byzantine artists. His draperies were also very good, but he had apparently no knowledge of perspective, though acquainted with architecture. His greatest pupil was Giotto (q.v.).

CIMAROSA, DOMENICO, an Italian composer of operas, was b. at Naples in 1749, and was educated in music under Sacchini, and in the conservatory of Loretto. His first pieces were the *Sacrificio di Abramo* and the *Olympiade*. When barely 22, he had achieved a reputation in all the leading Italian theaters. He was then called to St. Petersburg, where he resided four years. Afterwards, he lived at various German courts; thence he proceeded to Vienna, where he became imperial chapel-master; and finally, he returned to Italy. At Naples, his comic opera, *Il Matrimonio Segreto*, composed at Vienna, 1791, was repeated 57 times in succession. C. died at Venice in 1801.

CIMBALO, a musical instrument with a set of keys like the clavecin or harpsichord.

CIMBRI, or **KIM'BRI**, a people who issued from the n. of Germany in conjunction with the Teutones, and first came into hostile contact with the Romans in the eastern Alps in 113 B.C. They were victorious in several great engagements, and were only prevented from devastating Italy by sustaining a terrible defeat from Marius, on the Raudii Campi, near Verona, or, according to others, near Vercelli, in Aug., 101 B.C. Their infantry fought with their shields fastened together by long chains; their horsemen, of whom they had 15,000, were well armed with helmet, coat of mail, shield, and spear. Marius had so chosen his position that the sun and dust were in their faces, and yet they contested the victory most bravely with the Romans, who were 55,000 strong. When the battle was lost, the women, who remained in the camp formed of the wagons, killed themselves and their children. 140,000 C. are said to have fallen in the battle:

the number of prisoners is given at 60,000. It is not till long afterwards, when the Romans themselves penetrated into Germany, that the name of the C. again appears. Cæsar represents the Aduatici of Belgium as the descendants of the C. and the Teutones. Tacitus speaks of a people, bearing the name of C., few in number, but of great reputation, that sent ambassadors to Augustus. This people lived in the extreme n. of Germany, on the borders of the ocean; according to Pliny and Ptolemy, at the extremity of the peninsula called from them the Cimbric Chersonese, now Jütland. The ethnology of the C. is doubtful. Greek writers associated them groundlessly with the Cimmerians (q.v.); Sallust calls them Gauls; Cæsar, Tacitus, and Plutarch looked upon them as Germans, and the opinion of their German origin has been adopted by most moderns. Yet H. Müller, in his *Marken des Vaterlands* (1837), has endeavored to show that they belonged to the Celtic race, and lived originally on the n.e. of the Belgæ, of kindred origin; and that their name is the same as that by which the Celts of Wales designate themselves to this day—*Cymri*.

CIMEX and **CIM'CIDÆ**. See **BUG**.

CIMICIFUGA, or **BUGBANE**, an herb of the order *ranunculaceæ*. It is the black snake-root found in all the northern states, and much used in rural districts as a medicine, chiefly in the form of a decoction. It is believed to be useful in nervous diseases, rheumatism, and bronchitis.

CIMIN'NA, a t. of Sicily, in the province of Palermo, 18 m. s.e. of the city of that name. Population, 5000.

CIMMERIANS, or **CIMMERII**, in the poems of Homer, the name of the people dwelling "beyond the ocean-stream," where the sun never shines, and perpetual darkness reigns.—But the historic C. were a people whose country lay between the Borysthenes (Dnieper) and the Tanais (Don), including also the Tauric Chersonesus (Crimea). The Cimmerian Bosphorus (strait of Yenikale) derived its name from them. Being driven out by the Scythians, they migrated to Asia Minor, dwelt there for some time, plundered Sardis, failed in an attempt upon Miletum, and were finally routed and expelled by the Lydian king Alyattes, some time after 617 B.C.

CIM'OLITE. See **FULLERS' EARTH**.

CIMON, an Athenian commander, was the son of Miltiades, the conqueror at Marathon. In conjunction with Aristides, he was placed over the Athenian contingent to the allied fleet, which, under the supreme command of the Spartan Pausanias, continued the war against the Persians (477 B.C.). He effected the important conquest of Eion, a town on the river Strymon, then garrisoned by the Persians. Later (according to Clinton, 466 B.C.), when commander-in-chief, he encountered a Persian fleet of 350 ships at the river Eurymedon, destroyed or captured 200, and defeated the land-forces on the same day. He succeeded likewise in driving the Persians from Thrace, Caria, and Lycia; and expended much of the money which he had obtained by the recovery of his patrimony in Thrace upon the improvement of the city of Athens. At this period he appears to have been the most influential of the Athenians. The hereditary enemy of Persia, it was his policy to advocate a close alliance with Sparta; and when the Helots revolted, he led an army upon two occasions to the support of the Spartan troops; but on the latter occasion, having lost the confidence of his allies, he was ignominiously dismissed. After his return to Athens, his policy was opposed by the democracy, headed by Pericles, who procured his banishment by ostracism. He was recalled in the fifth year of his exile, and was instrumental in obtaining a five years' armistice between the Spartans and the Athenians. He died in the year 449 B.C., while besieging the Persian garrison of Citium, in Cyprus.

CINALOA, a t. of Mexico, in the state of the same name, on the Rio Cinaloa, about 50 m. from its entrance into the gulf of California. It was at one time a thriving place, with a population of 10,000, but has since been reduced to about 3000.

CINALOA. See **SINALOA**.

CINCHONA, a most important genus of trees of the natural order *cinchonaceæ*; yielding the bark so much valued in medicine, known as Peruvian bark, Jesuits' bark, China bark, quina, quinquina, cinchona bark, etc., and from which the important alkaloids *quina* or *quinine* (q.v.), and *cinchonina* or *cinchonine*, are obtained. The species of this genus are sometimes trees of great magnitude; but an after growth springing from their roots when they have been felled, they often appear only as large shrubs; and some of them in the highest mountain-regions in which they are found, are low trees with stems only eight or ten feet in height. They exist only in South America, between s. lat. 20° and n. lat. 10°, and chiefly on the eastern slope of the second range of the Cordilleras. All the cinchonas are evergreen-trees; with laurel-like, entire, opposite leaves; stipules which soon fall off; and panicles of flowers, which, in general appearance, are not unlike those of lilac or privet. The flowers are white, rose-colored, or purplish, and very fragrant. The calyx is small and 5-toothed; the corolla tubular with a salver-shaped 5-cleft limb. In the true *cinchonas*, the capsule splits from the base upwards; the species in which it splits from above downwards form the sub-genus *cascarilla*; the

distinction acquiring importance from the consideration, that the barks of the former alone contain the alkaloids so valuable in medicine; and this property is further limited to those species which have the corolla downy or silky on the outside. Beyond the botanical limits thus narrowly marked out, not a trace of these alkaloids has yet been discovered anywhere.

Great difficulty has been found in determining the species by which the different varieties of *C. bark* known in commerce are produced. The common commercial names are derived partly from the color of the kinds, and partly from the districts in which they are produced, or the ports where they are shipped. It appears, however, to be now ascertained that *calisaya bark*, also called royal or genuine yellow bark, one of the very best kinds—mostly shipped from Arica—is chiefly the produce of *C. calisaya*, a large tree, growing in hot mountain valleys of Bolivia and the south of Peru. To give all the varieties of bark and species of tree would go beyond our limits.

The accurate discrimination of the different kinds of bark requires much experience. The taste is always bitter; but it is possible even to distinguish by the taste those varieties which contain quinia most largely from those in which cinchonia is most abundant.

The cutting and peeling of *C. trees* are carried on by Indians, who go in parties, and pursue their occupation during the whole of the dry season. They build a hut, which serves both for their abode and for drying the bark. The trees are felled as near the root as possible, that none of the bark may be lost; and the bark being stripped off, is carefully dried; the quilled form of the thinner bark is acquired in drying. The bark is made up into packages of various size, but averaging about 150 lbs. weight, closely wrapped in woolen cloth, and afterwards in hides, to be conveyed on mules' backs to the towns. These packages are called drums or *seroons*. It is in them that the bark is always brought to Europe.

A number of spurious kinds of Peruvian or *C. bark* are either sent into the market separately, or are employed for adulterating the genuine kinds. They are bitter barks, and have, in greater or less degree, febrifugal properties, but are chemically and medicinally very different from true *C. bark*. They are produced by trees of genera very closely allied to cinchona.

Whilst *C. trees* have been becoming every year more scarce in their native regions, no attempt has been made to cultivate them there, notwithstanding the constantly increasing demand for the bark; but the Dutch have recently made extensive plantations of them in Java; and the same has been done in British India, from seeds and plants obtained from the South American governments, by Mr. Markham. In the course of his researches in South America, Mr. Markham found only one *C. tree* planted by human hands. See PERUVIAN BARK.

The Indians of Peru call the *C. trees kina*, from whence are derived the names *china*, *quina*, etc. But it is not certain that they knew the use of the bark before the arrival of the Spaniards. It is a medicine of great value in the cure of intermittent fevers (see AGUE), and diseases attended with much febrile debility; also in certain forms of neuralgia (q.v.), and other diseases of the nervous system. It seems to have been first imported into Europe in 1639, by the countess Del Cinchon or Chinchon, the wife of the viceroy of Peru, who had been cured of an obstinate intermittent fever by means of it, and upon this account it was named *C. bark* and *countess's powder* (*pulvis comitissæ*). The Jesuit missionaries afterwards carried it to Rome, and distributed it through their several stations, and thus is acquired the name of *Jesuit's bark* and *powder of the fathers* (*pulvis patrum*). Cardinal Juan de Lugo having been particularly active in recommending and distributing it, it was also known as *Cardinal de Lugo's powder*. It attained great celebrity in Spain and Italy, being sold at high prices by the Jesuits, by whom it was lauded as an infallible remedy, while by most of the orthodox physicians it was coldly received, and by the Protestants altogether repudiated. Its mode of action not being well understood, and the cases to which it was applicable not well defined, it seems, in the first instance, to have been employed without due discrimination, and to have fallen very much into the hands of empirics. Falling, however, into disuse in Europe, it was again brought into notice by sir Robert Talbot or Talbot, an Englishman, who brought it to England in 1671, and acquired great celebrity through the cure of intermittents by means of it, and from whom Louis XIV. purchased his secret in 1682. A pound of bark at that time cost 100 louis-d'or. Talbot seems to have been a vain and self-seeking man, but who had, nevertheless, the acuteness to discern and systematically to avail himself of the healing virtues of the neglected Jesuits' bark, which he mixed with other substances, so as to conceal its taste and odor. Soon afterwards, both Morton and Sydenham, the most celebrated English physicians of the age, adopted the new remedy; and its use, from this period, gradually extended, both in England and France, notwithstanding the opposition of the faculty of medicine in the latter country. As it came into general use, it became a most important article of export from Peru; but for a long time, the value of the bark to be procured in New Granada remained unknown; and in order to the maintenance of a commercial monopoly, extraordinary methods were even employed to prevent it from becoming known at a comparatively recent period of Spanish rule in America. The discovery of the alkaloids on which its properties chiefly depend, constitutes a new era in the history of this medicine, and did not take place till the beginning of the present century.

The chief active principles are the two alkaloids, quinine (q.v.) and cinchonine. The latter is not generally present in so large a proportion as the quinine, and does not possess such powerful medicinal properties. When isolated, the alkaloid *cinchonina*, or cinchonine, has the formula $C_{19}H_{22}N_2O$, and can be obtained in a crystallized state.

C. bark itself has, in later times, fallen into comparative disuse, owing to the discovery of the alkaloid quinine, which is now extensively in use in medicine in the form of sulphate or disulphate of quinine, and is given in doses of from one to twenty grains, in almost all the cases to which the bark was supposed to be applicable.

CINCHONA CEÆ, a natural order of exogenous plants, consisting of trees, shrubs, and herbaceous plants, with simple, entire, opposite, or whorled leaves, and stipules between their foot-stalks. The calyx is adherent to the ovary; the corolla is tubular and regular, its segments are equal in number to those of the calyx, when the calyx is divided; the stamens arise from the corolla, and are alternate with its segments. The ovary is surrounded by a disk, and usually two-celled; the style single, the fruit either splitting into two halves or not splitting at all, either dry or succulent.—This order has been very generally regarded by botanists as a sub-order of *rubiacæ* (q.v.), but far exceeds all the rest of that order, both in the number and importance of its species, of which from 2,500 to 3,000 are known, mostly tropical, and the remainder, with few exceptions, sub-tropical. The C. are nearly allied to *caprifoliaceæ* (woodbines or honeysuckles, etc.), (q.v.).

CINNINNATI, capital of Hamilton County, Ohio, chief city in the state, and ninth in the United States in population, is on the right bank of the Ohio River, in latitude $39^{\circ} 6' 30''$ north, and longitude $84^{\circ} 26'$ west, and is the geographical centre of a valley 200 miles in extent, one of the most fertile in the world. It lies midway between Pittsburgh and Cairo, 116 miles southwest of Columbus, 270 miles southeast of Chicago, 340 miles northeast of St. Louis, 764 miles from New York, 610 miles from Washington, and 2100 miles from New Orleans.

As early as 1780 land was purchased at this point from the United States Government by John Cleves Symmes, and two block-houses were erected here. The settlement received the name of Losantiville, meaning "the town opposite the mouth of the Licking." Another city was projected by the same person at the junction of the Ohio and Great Miami Rivers, but this was destroyed by floods, and the Government deciding to build Fort Washington at Losantiville, on Mill Creek, it thus made Cincinnati the central point. Gen. St. Clair made it the county seat, but for some years it was only a village of log cabins. Settlers began to arrive from New Jersey, and it soon attracted emigrants from New England and the South. It received its present name from Gen. St. Clair, in honor of the Society of the Cincinnati (q.v.). It was incorporated in 1802, but its progress was slow until steam navigation was introduced, in 1816. On the completion of the Little Miami Railroad, in 1840, immigration increased, and a large number of Germans settled there. In 1802 a Young Ladies' School was opened, and in 1814 the Cincinnati College and Lancaster Academy were founded. Cincinnati's nearness to the slave states, and its social and commercial relations with their citizens, led to the opposition of anti-slavery measures, and even the discussion of slavery was dangerous. Two or three times a press established by James G. Birney was destroyed by a mob, with the excuse that the city's trade with the South could not be retained if an anti-slavery paper were tolerated. The city was a rendezvous for fugitive slaves on their flight to Canada, and no less than 3000 were harbored by Levi Coffin, a quaker citizen. In 1862 it became necessary to place the city under martial law, when an attack by a Confederate force was expected, so large a proportion of the citizens was in sympathy with the South. In 1884, March 28th–31st, a riot occurred, and an armed mob broke into the jail to lynch some murderers who had escaped the full penalty of their crime; on being frustrated they burned the Court-House and other buildings. The state militia was called out, and forty-five persons were killed and 138 wounded before order could be restored.

The "Queen City of the West" is built upon two plateaux 400 to 500 feet above the level of the sea. It is nearly surrounded by hills forming a semicircle, which approach close to the river above and below the enclosed plain, the ends of the semicircle being only two miles and a half apart. The first plateau is sixty-five feet above low-water mark, and rises on the north side 400 feet above the Ohio River, which forms here a grand curve from east to west; and the second is elevated fifty to 100 feet higher, some points reaching an elevation of 900 feet above the sea-level. These highlands are pierced by ravines, which gives a most picturesque effect to the city, and are covered with the beautiful residences of opulent citizens. The streets and avenues average 66 feet in width, crossing each other at right angles in the old portion and conforming to the surface conditions in the new. The summits of the hills, which have been made accessible, command highly interesting views of the rolling country surrounding the city. Of the three terraces by which the ascent is made, the lowest, or "bottom," streets are mainly given up to manufacturing and wholesale trade. The city covers an area of 37 sq. m., having annexed several suburban villages. The brick and freestone found near at hand and the blue limestone quarried within the city limits are largely used for building materials. The average temperature in summer is 75.24° ; in winter, 34.28° ; the yearly mean being 54.72° .

Cincinnati has several fine parks, well wooded and picturesque. The famous Eden Park, or "Garden of Eden," has 216 acres enclosed, with fine views of the city,

and contains the Art Museum which cost over \$350,000. Burnet Woods, another delightful park, contains 170 acres. There are twenty-six cemeteries; Spring Grove, the most celebrated, has 600 acres of land, lies six miles from the city, and is approached by an avenue 100 feet wide. Among its costly monuments are the Dexter Mausoleum and a bronze statue commemorating the soldiers who died in the Civil War. Beautiful suburban villages cluster about, to which miles of street railroads give access. Roads and bridges connect with Newport and Covington, Ky., on the opposite side of the river. Ludlow, Bellevue, Linwood, Mt. Lookout, Oakley, and Riverside are some of the nearby towns filled with large and costly dwellings set in extensive grounds. "Over the Rhine" is the designation of that part of the city between the canal and the hills; it is inhabited almost exclusively by Germans, and is famous for its concert and beer gardens. The largest (wire suspension) bridge across the Ohio was designed by J. A. Roebling, and completed in 1867 at a cost of \$1,800,000. It is 2252 feet long and 106 feet above low-water mark. Another bridge of wrought iron resting upon stone piers connects Cincinnati with Newport, Ky. A third bridge connects the city with Ludlow, Ky.; the bridge of the Chesapeake and Ohio railroad cost \$3,348,675, and has the longest truss-span in the world; and a fifth bridge is a cantilever. There are more than twenty street-railroad lines, some of which are inclined planes and some electric and cable.

The central and business portions of the city are compactly built, almost the entire valley being filled up. As the terraces rise, one above another, the streets become more irregular and the buildings with extensive grounds, are spread out with a more picturesque effect than in any other city. A fine public landing or levee extends along Front Street, the shore being well paved, and with floating docks and wharf boats.

The United States Government Building, containing the Post Office, Custom House, Court Rooms, and various offices, was erected at a cost of \$5,000,000. It is of sawed freestone, three stories high, in the Roman-Corinthian style. The Custom House is equally fine and much larger. The County Court House, with the Jail, occupies a whole square; it is three stories high, built in the Romanesque style, and nearly fire-proof. The City Hospital, consisting of eight distinct buildings arranged around a central court, occupies a square of nearly four acres. It cost over \$700,000, exclusive of the ground, which is worth \$300,000 more. It will accommodate 700 patients. Masonic Temple and Odd Fellows' Hall are grand buildings. The Chamber of Commerce is another elegant building, and the City Hall cost \$1,500,000. The City Workhouse has cells for 700 prisoners, with workshops and grounds for their employment. Longview Asylum for the Insane, at Carthage, ten miles from the city, is of brick in the Italian style, four stories in height. St. Peter's Roman Catholic Cathedral is an immense structure in pure Grecian architecture, with a stone spire 224 feet high. St. Paul's Methodist Episcopal Church, the First and Second Presbyterian Churches, St. John's Protestant Episcopal, and the Jewish Synagogue are all worthy of note. The First Presbyterian has the loftiest spire in the West, 285 feet high.

Among the buildings devoted to amusement, Pike's Opera House is justly celebrated. The Springer Music Hall, used also as an exposition building, is 500 by 300 feet, and contains the largest organ in the United States. The hall seats 5400 persons, and with the organ cost \$1,000,000. The Grand Opera House, Havlin's Theatre, College Hall, Greenwood Hall, the Lyceum, Arbeiter Hall, Turner Hall, Heuck's Opera House, and Robinson's Theatre are also elegant structures. Owing to the large number of German residents, this city has become noted for its musical societies, and it is fast becoming the centre of social culture, literature, and the fine arts in that section of the country. Cincinnati is the seat of a Roman Catholic archbishop.

The educational advantages of this city are unsurpassed, with several high schools, many public schools and intermediate schools, and thousands of pupils, employing hundreds of teachers. The higher institutions include a Normal school; the University of Cincinnati, an outgrowth of McMicken University, which has an astronomical department with an observatory at Mt. Lookout, and new collegiate buildings in Burnet Woods park; Wesleyan Female College; Hebrew Union College; St. Joseph's and St. Xavier's Jesuit colleges; several medical, musical, and commercial colleges; Lane theological seminary at Walnut Hills, colleges of law, pharmacy, and dentistry, the Franklin school, Cincinnati art academy, and the Hughes and Woodward high schools.

The Ohio Mechanics' Institute is a strong factor in the education of the masses. It has many pupils who attend the day and night schools, where they are instructed in literature, science, and mathematics, and have the advantage of a large library, lectures, etc. The principal museum, situated in Eden Park, was founded by the ladies of Cincinnati. It is a large building, modelled in its construction and in the system of instruction given in its art school after the South Kensington Museum of England. It has many fine paintings, statues, and works of art, and hundreds of students. The most noted public piece of ornamentation is the Tyler-Davidson fountain, on Fountain Square, Fifth Street, which was cast at the Royal Foundry in Munich, and cost \$200,000. The Garfield Statue at Eighth and Race Streets is a work of great merit.

There are many libraries, including the Public, the Young Men's Mercantile, Law, the Historical, and the Mechanics'. This city has a Zoölogical Garden containing sixty acres of hills, valleys, and ravines well stocked with wild animals of all kinds.

Cincinnati had (in 1890) 7832 manufacturing establishments, which gave employment to 96,689 workmen, paying them in wages \$47,691,332; total receipts, \$196,063,983. Among the leading industries are men's factory clothing, valued in 1890 at \$17,951,525; distilled liquors, \$11,471,673; malt liquors, \$7,454,417; foundry and machine-shop products, \$10,090,564; carriages and wagons, \$8,669,312; boots and shoes, \$6,024,454; furniture, \$4,208,974; tobacco and cigars, \$3,288,453; soaps and candles, \$3,826,480; and slaughtering, \$2,607,885. Besides these are manufactured largely iron and steel forgings, trunks, valises, all kinds of tanned and curried leather goods, wire-work, scales and balances, brick and tile, carriages and buggies, bridges, cutlery, hosiery and cotton goods, cars, cheese and butter, brooms, brushes, wood-turning products, etc. The Rockwood Pottery produces purely American wares of high artistic merit, which are extensively known.

The police force is efficient and well conducted, the outlying wards being protected by mounted patrol. The military organizations are the First Regiment of Infantry, a Battery and the First Regiment of Artillery, O. N. G. The fire department is well supplied with steam and chemical engines, hook and ladder trucks, hose carriages, men and horses. Water is pumped from the Ohio into reservoirs in Eden Park, from which are supplied cisterns, mains, and hydrants.

The city government is conducted upon the federal plan. The Mayor appoints his own Board of Administration, the members of which have charge of improvements and repairs; a Board of Park Commissioners; Board of Review; Board of Election, and the Prosecutor of the Police Court. He is the Chief of Police, with all the powers of an officer of the army. The Board of Police Commissioners is appointed by the Governor.

The commanding position of Cincinnati brings the city into admirable commercial relations with the Mississippi and Ohio valleys. The amphitheatre of hills opens for the spacious Mill Creek, half a mile in width at the narrowest part, and through this and the narrow river valley passes and repasses the vast fleet of steamboats and barges that conveys the treasures of coal and iron and lumber from the Alleghanies, and the produce of the South to the shores of the Queen City. The commerce by water is very large. The Cincinnati, Portsmouth, Big Sandy, and Pomeroy, and Memphis and Cincinnati Packet Companies, and the United States Mail Company control much of the trade of the 1000 miles of the Ohio and 200 miles of tributary streams. The Southern Transportation Lines conduct the business with New Orleans.

Population in 1810, 2540; 1830, 115,435; 1870, 216,239; 1880, 255,139; 1890, 296,908.

CINCINNATI, SOCIETY OF THE, a society or order in the U. S. established in June, 1783, by the officers of the revolutionary army at their cantonment near Newburg, N. Y. Its object was to perpetuate the friendships formed during the contest recently ended, to keep alive the patriotism of its members, and to provide for the needy among their number. The name chosen was highly appropriate, inasmuch as many of its members, like Washington, had left peaceful pursuits to serve their country. (See **CINCINNATUS**.) A number of French officers who had served in the American army, or in the French navy on the American coast, were made honorary life members.

The distinction having been made hereditary, was bitterly attacked as opposed to republican equality, as by Franklin, who saw in it the germ of a future aristocracy. In several states charters were refused to the branch societies, and after an existence of 20 years or more, the societies of Connecticut, Delaware, New Hampshire, Rhode Island, and Virginia were dissolved, leaving the societies of Massachusetts, Maryland, New York, New Jersey, Pennsylvania, and South Carolina. The membership in France was so reduced by the revolution in that country, that no meetings were held after 1792.

The badge of the society is a bald eagle suspended by a dark blue ribbon with white borders, symbolizing the union of France and America. On the breast of the eagle there is a figure of Cincinnati receiving the military ensigns from the senators, with the plow in the background; round the whole are the words: *Omnia reliquit servare rempublicam*. On the reverse, the same hero is represented crowned by fame with a wreath, on which is inscribed: *Virtutis primum*, etc. The vote of the general society determines whether the eldest son or the next in order to the deceased member is worthy of admittance. Where there is no direct male posterity, the right of membership passes to a member of a collateral branch.

At the second general meeting, in 1787, Washington was elected president-general, and was re-elected every third year during his life. His successors in office were Alexander Hamilton and the Pinckneys; and when Lafayette visited this country, in 1824, he was its only surviving maj.-gen. The last survivor of the original association was Robert Burnet, of New York, who died in 1854. The general society, of which Hamilton Fish, of New York, is the presiding officer, meets biennially, but the state societies hold annual meetings.

It has been thought that the society has some political partisan significance or inclination, but this is not the fact. The Tammany society was started to oppose the society of the Cincinnati, because the latter was supposed to be established in the interest of the wealthier and more aristocratic classes. See *North American Review*, Oct. 1853; *Memoirs of the Pennsylvania Historical Society*, vol. VI.

CINCINNATUS, LUCIUS QUINTIUS, a Roman consul, regarded by the later Romans as the model of antique virtue and simple manners. So far as we can discern his char-

acter through the veil of legend, C. appears to have been a violent patrician. About 460 B.C., he was chosen consul, and two years later was made dictator. When the messengers from Rome came to tell C. of his new dignity, they found him plowing on his small farm. He soon rescued the consul Lucius Minucius, who had been defeated and surrounded by the Æqui. Livy's account of the mode in which the deliverance was effected is rejected by Niebuhr, who points out the inconsistencies and impossibilities of the story, and seems disposed to regard the whole as a mere myth. We are next informed that, after a dictatorship of sixteen days, C. returned to his small farm on the Tiber. When 80 years old, he was once more made dictator (439 B.C.), and suppressed a threatened plebeian insurrection.

CIN'EAS, the chief adviser of Pyrrhus, king of Epirus. His most famous work was in visiting Rome, to arrange for peace, after the defeat of the Romans in 280 B.C. In Rome, he learned in a single day the name of every man of importance in the city. He was not successful in securing peace, and when he returned he told Pyrrhus that Rome was a temple and its senate an assembly of kings.

CINERA'RIA, a genus of plants of the natural order *compositæ*, sub-order *corymbifera*, very nearly allied to *senecio* (groundsel, ragwort, etc.), from which it differs only in having the involucre formed of one row of equal erect scales. The species are numerous, and widely diffused over the world in very various climates. They are annual or perennial herbaceous plants; with simple, generally toothed or sinuate leaves. Many of them are remarkable for the ashy appearance of the lower part of the leaves, whence their name (Lat. *cinis*, -*eris*, ashes). The leaves are often covered with a peculiar sort of down.

CIN'ERARY URNS (Lat. *cinis*, ashes) were used by the nations of antiquity to contain the ashes of the dead when gathered from the funeral pile. Previous to being deposited in the urn, the embers were soaked with wine; the urn was then placed in a niche in the family mausoleum. Only the wealthy could afford so expensive a rite. C. U. were either sculptured in marble, or formed of clay or glass. See BURIAL; CREMATION.

CINGALESE, or SINGHALESE. See CEYLON.

CIN'NA, LUCIUS CORNELIUS, a Roman noble, was one of the principal supporters of the faction of Marius. After Sulla had driven Marius from the city, and before setting out on his expedition against Mithridates, he allowed C. to be elected to the consulship. But C. had no sooner entered upon that office (87 B.C.), than he impeached Sulla, endeavored to form an interest among the citizens who had been added to Rome after the social war, and agitated for the recall of Marius. The events which led to the return of Marius are stated in the article Marius (q.v.). After a cruel massacre of the Roman citizens, in which some of the most eminent statesmen and orators were slain, Marius and C. declared themselves consuls. On the death of Marius, which occurred within a few days of his usurpation, C. made L. V. Flaccus his colleague for that year, and C. P. Carbo for the two succeeding years. In 84 B.C., he prepared to meet Sulla, who was then on his way from the east to take vengeance upon his enemies, but was slain by his disaffected troops at Brundisium. His daughter Cornelia married Julius Cæsar.

CIN'NABAR, an ore of mercury, from which almost all the mercury of commerce is obtained. Chemically, it is a bisulphuret of mercury, containing 86.2 parts of mercury and 13.8 of sulphur. It occurs both crystallized and massive, not unfrequently disseminated. Its crystals are six-sided prisms. It varies from perfectly opaque to almost transparent; has an adamantine almost metallic luster, and a carmine color, with a bright scarlet streak. Its specific gravity is 8 to 8.2. *Hepatic C.*, so called from its liver-brown color, is a variety containing a little carbon. C. sometimes occurs in primitive rocks, but more frequently in those of the coal formation, and is sometimes even intimately mixed with coal itself. It is, however, a rare mineral, and is nowhere found in Britain. The C. mines of New Almaden, California, are the most productive in the world. C. is used as a pigment under the name of *vermillion*.

CINNAMIC ACID AND THE CINNAMYL SERIES. Cinnamyl is a compound radical, as yet unisolated, which is represented by the formula $C_6H_5 \cdot CH : CH \cdot CO \cdot$, and which includes among its compounds cinnamic acid, $C_6H_5 \cdot CH : CH \cdot COOH$, oil of cinnamon, which is chemically a slightly impure aldehyde of cinnamic acid, or a hydride of cinnamyl, $C_6H_5 \cdot CH : CH \cdot CHO$, chloride of cinnamyl, $C_6H_5 \cdot CH : CH \cdot COCl$, styrene or peruvine, known chemically as cinnamic alcohol, $C_6H_5 \cdot CH : CH \cdot CH_2 \cdot OH$, styrol, represented by the formula $C_6H_5 \cdot CH : CH_2$, and styracin, $C_6H_5 \cdot C_6H_7O_2$. We shall briefly notice the most important of these compounds—viz., cinnamic acid and oil of cinnamon. *Cinnamic acid*, $C_6H_5 \cdot CH : CH \cdot COOH$, crystallizes in colorless prisms, which are sparingly soluble in cold water, but dissolve readily in boiling water, alcohol, and ether. It fuses at 271.4° F. (133° C.), and boils with or without decomposition, according to the manner in which it is heated, at about 572° F. (300° C.). It is converted by most decomposing agents into benzoyl compounds, such as benzoic acid, oil of bitter almonds, etc.; for example, when fused with hydrate of potash, it assimilates the elements of water, and breaks up into acetic and benzoic acids; when boiled with peroxide of lead, it is converted into oil of bitter almonds and benzoic acid, etc. It exists naturally in a free state in liquid storax, the balsams of Tolu and Peru. and gum benzoin, and is often

deposited in large crystals from old samples of oil of cinnamon and from cinnamon water. It is always formed from oil of cinnamon when the latter is exposed to the action of the air. Cinnamic acid is one of the first steps in the preparation of artificial indigo, and for that purpose it is prepared on a large scale by heating benzalchloride, $C_6H_5 \cdot CHCl_2$, and fused sodium acetate, $CH_3 \cdot COONa$, together in closed iron vessels. *Oil of cinnamon* and *oil of cassia*, although prepared from different kinds of trees, are virtually identical in their composition, each consisting mainly of cinnamic aldehyde, or hydride of cinnamyl, mixed with certain resinous matters.

CINNAMON is the spicy, aromatic, and stimulating bark of certain species of the genus *cinnamomum*. This genus belongs to the natural order *lauraceæ*, and was formerly included in *laurus*. It contains a considerable number of species, natives of tropical and subtropical parts of the east. C. has been in use from the remotest antiquity. It is mentioned in the Old Testament, and by a name almost the same as that which it still bears in most languages. The finest kind is said to be chiefly produced by *cinnamomum zeylanicum* (formerly, *laurus cinnamomum*), which chiefly grows in the island of Ceylon, although, having been introduced into the West Indies in 1782, along with various other plants of the east, it is now cultivated there to some extent. The tree attains the height of 20 to 30 ft., and is sometimes 1½ foot in thickness. Its bark is of a grayish-brown color, internally of a yellowish red. The leaves are oval, 4 to 6 in. long, with a blunt point, and marked with three principal nerves. They have the taste of cloves. The flowers are of a silky gray on the outside, and a pale-yellowish color internally. The fruit is somewhat like an acorn in shape; it is a small drupe, brown when ripe. There are two seasons of cinnamon-harvest in Ceylon, the first commencing in April, and the last in Nov.—the former being that in which the chief crop is obtained. The branches of 3 to 5 years' growth being cut down, the epidermis is scraped away; the bark is then ripped up longitudinally with a knife, and gradually loosened, till it can be taken off. The slices are then exposed to the sun, when, as it dries, it curls up into *quills*, the smaller of which are inserted into the larger, and the whole tied up in bundles of about 88 lbs. each. C. is examined and arranged according to its quality by persons who are obliged for this purpose to taste and chew it, although in a short time it produces painful effects on their mouths and tongues. The finest C. is yielded by the young branches of the tree, especially by the numerous shoots which spring up from the stump after a tree has been cut down, and which are cut when about 10 ft. long, and of the thickness of an ordinary walking-stick. The smell, particularly of the thinnest pieces, is delightfully fragrant, and the taste pungent and aromatic, with a mixture of sweetness and astringency. It is used like other spices by cooks and confectioners, and also in medicine as a tonic, stomachic, and carminative. The average quantity annually imported into London is about 500,000 lbs. Its virtues depend chiefly upon the essential oil which it contains (*oil of cinnamon*). Oil of cassia is very often substituted for this oil, as cassia—which, however, may readily be distinguished by its mucilaginous taste—is for cinnamon. The root of the cinnamon-tree contains camphor. The fruit yields a concrete oil, called *cinnamon suet*, which is highly fragrant, and in Ceylon was formerly made into candles, for the exclusive use of the king.—Cassia (q.v.) is the produce of another species of *cinnamomum*.—*C. loureirii*, a native of Cochin China and Japan, is said to yield a bark even superior to that of *C. zeylanicum*. A species of C., ascends to the elevation of 8500 ft. in the Sikkim Himalaya. See *illus.*, **TEA, COFFEE**, **ETC.**, vol. XIV.

The constituents of C. are a volatile oil (*oil of C.*), tannin, starch, mucilage, woody-fiber, resin, coloring matter, and an acid. The oil of C. is generally prepared in Ceylon by grinding the coarsest pieces of C., soaking them in sea-water for two or three days, and then distilling. Two oils pass over, one lighter, the other heavier than water. Oil of C. varies in color from yellow to cherry-red, the yellow variety being considered the best, and is most highly esteemed. *Oil of C. leaf* is prepared from the leaves in Ceylon by a similar process, and is met with in commerce under the name of *clove oil*, which it much resembles in odor. *C. water* is obtained by adding water to C., and distilling a large quantity, or by diffusing the *oil of C.* through water by the aid of sugar or carbonate of magnesia. *Spirit of C.* is procured by acting upon C. with spirit of wine and water, and distilling. The medicinal properties of C., and its preparation, are aromatic and carminative, and it is serviceable in cases of nausea and vomiting, and in cases of flatulence and spasmodic states of the stomach and alimentary canal.

CINNAMON-STONE, a precious stone, of which the finer specimens are highly esteemed; it is regarded as a variety of garnet (q.v.). Its color varies from hyacinth red to orange yellow; and when pure, it is transparent. It is composed essentially of silica, alumina, and lime. It is found chiefly in Ceylon.

CINNYRIS. See **SUN-BIRDS**.

CINQUE CEN'TO (Ital.), five hundred. A technical, or rather *slang* artistic term, used to designate the style of art which arose in Italy after the year 1500, and which therefore belongs to the 16th c.; i.e., after the fall of all the great schools. It is sensuous in its character, the subjects chosen being usually borrowed from heathen mythology or history.

CINQUE FOIL, in botany. See **POTENTILLA**.

CINQUEFOIL, a common bearing in heraldry. It is usually depicted with the leaves issuing from a ball as a center point.—C., in architecture, is an ornamental foliation in five compartments, used in the tracery of windows, panelings, and the like. The C. is often represented in a circular form, the spaces between the points or cusps representing the five leaves.

The C. of heraldry and of architecture is not derived from any leaf of five leaflets, but, as its perfect regularity of form indicates, from the flower of the plant called *C. (potentilla)*, or other similar flower of five petals or *leaves*. The C. thus closely resembles the rose, with which it would, indeed, be identified, but that a double and not a single rose is chosen for the purposes of heraldry and decorative art.

CINQUE PORTS (Fr. five ports). It is said that the five maritime ports of England lying opposite to the coast of France—Sandwich, Dover, Hythe, Romney, and Hastings—were enfranchised in the time of Edward the Confessor. But it was subsequent to the battle of Hastings that the conqueror, in order that he might wield the resources of the seaports with greater vigor, constituted this whole line of coast into a jurisdiction entirely separate from the counties of Kent and Sussex, and erected it into a sort of county palatine, under a warden or guardian, the seat of whose administration was in Dover Castle. The warden, whose office corresponded to that of the ancient count of the Saxon coast (*comes littoris Saxonici*), exercised jurisdiction, civil, military, and naval, uniting in his single person the functions of sheriff, *custos rotulorum*, lord-lieutenant, and admiral. Privileges equal to those originally bestowed on the C. P. were subsequently extended to the so-called *ancient towns* of Winchelsea and Rye, and most of the municipal towns had subordinate ports and towns attached to them, which were called *members*. In place of the Saxon terms of *aldermen* and *freemen*, those of *jurats* and *barons* were introduced, and the latter term has always been applied to the representatives of the C. P. in parliament. The chief function performed by the C. P. in early times consisted in furnishing such shipping as was required for the purposes of the state, the crown having possessed no permanent navy previous to the reign of Henry VII. In the time of Edward I., they were bound to provide no less than 57 ships, fully equipped and manned at their own cost; though the weight of this heavy burden was somewhat lessened by the provision, that the period of gratuitous service should be limited to 15 days. In consequence of the warlike navy which they were thus compelled to maintain, the C. P. became so confident in their strength, and so insolent and audacious, as not only to undertake piratical expeditions, but even to make war and form confederacies as independent states. Previous to the revolution of 1688, the lord-wardens were in use to nominate the barons, or parliamentary representatives of the C. P.; but in 1689, an act was passed to "declare the right and freedom of election of members to serve in parliament for the cinque ports." The reform bill of 1832 reduced the number of members sent to parliament by the C. P. from 16 to 8, and the municipal reform act has broken up the ancient organization of the ports, and assimilated their internal arrangements to those of other English municipalities. The ancient courts of Stepway, Brotherhood, and Guestling are still occasionally held, but their powers scarcely extend beyond matters of form, such as appointing the barons, who are to exercise an ancient privilege of the ports, which consists in carrying the canopy over the sovereign's head at a coronation. The lord-warden's jurisdiction, in relation to civil suits and proceedings, was abolished by 18 and 19 Vict. c. 48, amended by 20 and 21 Vict. c. 1.

CINTRA, a small but picturesquely situated town in Portugal, in the province of Estremadura, about 15 m. w.n.w. of Lisbon, with a pop. of 5000. It stands on the declivity of the Sierra de Cintra, and is surrounded by country residences. There is a palace at C., a strange mixture of Moorish and Christian architecture, anciently occupied by the Moorish kings, and subsequently a favorite residence of the Christian monarchs. A charming view of the town and of the sea is to be had from the top of a hill crowned with the ruins of a Moorish castle. On another hill-top stands La Pena, once a convent, afterwards a residence of the king of Portugal, who restored and gave it the outward appearance of a feudal castle. In the neighborhood, also, is what is called the Cork convent, which derives its name from the cells—which are cut out in the rock—being lined with cork to prevent damp.

C. is historically remarkable for the *convention* concluded here, Aug. 22, 1808, between the English and French, by which the latter agreed to evacuate Portugal. Junot had been defeated by sir Arthur Wellesley at Vimieira, and had retreated towards Torres Vedras and Lisbon, whither the English under sir Hew Dalrymple, who had just arrived and assumed the chief command, were preparing to follow them. But the French, despairing of finally holding out, agreed to evacuate the country, on condition of not being treated as prisoners of war, but landed on the coast of France, retaining their arms and effects. This convention excited the greatest public indignation both in the Peninsula and in England. Several English newspapers appeared in mourning, and the ministry were obliged to have the generals who signed the convention tried by a court-martial, which, however, resulted in their acquittal. In fact, though the terms of the convention might be advantageous for the French, to obtain immediate possession

of Portugal and Lisbon, instead of being put to the necessity of a bloody siege for months, was no less advantageous to the English and their allies. Such, at least, was the opinion of two competent judges—Napoleon and Wellington.

CIO'NE, ANDREA DI. See ORCAGNA.

CIOTAT, LA, a t. of France, in the department of Bouches-du-Rhone, situated on the w. side of a bay in the Mediterranean, about 15 m. s.e. of Marseilles, in the midst of a district clad with olive, orange, and pomegranate plantations. It is well built and has a good and commodious harbor, formed by a mole, and well defended. The industry consists in cotton-spinning, ship-building, and an active trade in the produce of the district. Population of commune '91, 12,223.

CIPANGO (sometimes written *Zipangu*, *Zipangri*, or *Cimpagu*). See MYTHICAL ISLANDS.

CIPHER, an ornamental arrangement of the initial letters of a name, by which they become also a private mark, adopted by artists and architects as distinctive of their work. That of Albrecht Dürer is well known.

CIPHER-WRITING. See CRYPTOGRAPHY.

CIPRIA'NI, GIAMBATTISTA, painter and copper-engraver, was b. in Florence, 1732, or, according to others, in 1727, and when 19 years old, went to Rome, where he chose Correggio as a model, and soon gained a high reputation. Invited by certain English residents in Rome, the artist came to London about 1754, where he was one of the first members of the Royal Academy (founded 1769) and died in 1785. His drawing is correct, his coloring harmonious, his heads have grace and loveliness, and the general style of his works is attractive, although exceedingly conventional. A series of small copper-plate illustrations of *Orlando Furioso* well exemplifies his graceful style. Several of Bartolozzi's best engravings are in C.'s manner.

CIRCE' A (from *Circe*, q.v.), a genus of rather pretty little herbaceous plants of the natural order *Onagraceæ*, with a deeply 2-cleft calyx, a corolla of two petals, and two stamens. *C. lutetiana* is frequent in shady situations in Britain, and in most parts of the continent of Europe. It bears the English name of ENCHANTER'S NIGHTSHADE, and in Germany it is called Hexenkraut (witches' herb).

CIRCAR, an Indian term applied to the component parts of a province, each of which is administered by a deputy governor. In English, it is principally employed in the name of the Northern Circars, used to designate a now obsolete division of the Madras presidency, which consisted of a narrow slip of territory lying along the w. side of the bay of Bengal, from 15° 40' to 20° 17' north. These Northern Circars were Cicacole, Rajahmundry, Ellore, Condapilly, and Guntoor, in all 30,000 sq. miles.

CIRCASSIA, a division of the Western Caucasus, comprising the n., and also a portion of the s. slope of that mountain-range extending in lat. 42° to 45° n., and long. 37° to 47° east. See CAUCASUS.

CIRCASSIANS, in the wide sense of the term, is the name given to all the independent tribes of the Caucasus; in a narrower sense, it denotes the tribes who inhabited the western part of the range which is called, in consequence, Circassia. The C. proper, however, occupied only the s.w. wing of the Caucasus, with the exclusion of Abasia, or the portion between the Black sea in the w. and the lower bank of the river Kuban in the north. They call themselves Adighé, but the Russians and Turks call them *Tcherkesses*. On their conquest by Russia in 1864, rather than remain in subjection to that power they chose to emigrate to Turkey, and from 400,000 to 500,000, or nearly the whole nation of 15 tribes, carried this resolution into effect. The greater part of them were distributed over the Turkish possessions in Asia Minor, but others were settled in the mountainous parts of Bulgaria and on the borders of Servia. In their original country they were a marauding and warlike people, amongst whom it was held more honorable to live by plunder than by peaceful industry. In common with all brigand tribes, the C. cherished the most unrestrained love of independence. Their government was a singular compound of constitutionalism and feudalism. There were five distinct ranks in the nation—viz., chiefs or princes, nobles, common freemen, dependants, and slaves. The class of common freemen made up the great mass of the people; they possessed property, and enjoyed the same political rights as the nobles. The fourth class, the dependants, were the vassals of the princes and nobles, whose lands they cultivated, and whose armies they formed. Yet their lord had no right over their persons; for in some cases they and their whole families left him; and they could only be sold as slaves for punishment according to the previous verdict of a national assembly. The fifth class comprised the slaves, or those who had been made captive in war. That the C. have not lost some of the worst traits of their natural character since their settlement in Turkey is shown by their participation in the Bulgarian massacres of 1876 and 1877.

The C. princes and nobles are principally Mohammedans, whilst the great mass of the people have a religion which is a kind of mixture of Christianity and paganism, in which the celebration of Easter, the sign of the cross, sacred trees, sacrifice, and processions with lights, play an important part. Besides agriculture and the raising of cattle, they possess a few other branches of industry. The C. are proverbially handsome;

they are also strong, active, and temperate, and are characterized by the higher attributes of self-dependence, courage, and prudence. As a nation they made their first historical appearance during the middle ages. They are, however, chiefly known through their long struggles to maintain their independence against the aggression of Russia. See CAUCASUS. For their place in ethnology, see CAUCASIAN VARIETY OF MANKIND. For type of people, see *illus.*, ETHNOLOGY, vol. V.

CIRCE, a fabulous sorceress, is described by Homer as "fair-haired, a clever goddess, possessing human speech," sister of "all-wise Æetes," daughter of "the Sun, who gives light to mortals, and of Perse, whom Ocean begot as his daughter." Round her palace in Ææa were numbers of human beings, whom she had changed into the shapes of wolves and lions by her drugs and incantations. She changed two-and-twenty of the companions of Ulysses into swine, but that hero, having obtained from Mercury the herb *moly*, went boldly to the palace of the sorceress, remained uninjured by her drugs, and induced her to disenchant his comrades. He remained with her for a year; and when he departed, she instructed him how to avoid the dangers which he would encounter on his homeward voyage (*Odyssey*, books x. and xii.). Jealous of Scylla, whose love was sought by Glaucus, she poured the juice of poisonous herbs into that part of the sea where her rival was accustomed to bathe, and changed her into a monster.

CIRCE II. a t. of ancient Italy, in Litium, at the foot of Mons Circeius, a short distance from the sea, 10 or 12 m. from Terracina. Its ruins are still visible on the Montedella Cittadella, and consist of walls and gateways, built of polygonal blocks.

CIRCENSIAN GAMES. See CIRCUS.

CIRCLE, a plane figure bounded by a curved line, which returns into itself, called its *circumference*, and which is everywhere equally distant from a point within it called the *center* of the circle. The circumference is sometimes itself called the C., but this is improper; C. is truly the name given to the space contained within the circumference. Any line drawn through the center, and terminated by the circumference, is a *diameter*. It is obvious that every diameter is bisected in the center. (See ARC, CHORD.) In co-ordinate geometry, the C. ranks as a curve of the second order, and belongs to the class of the conic sections. It is got from the right cone by cutting the cone by a plane perpendicular to its axis. The C. may be described mechanically with a pair of compasses, fixing one foot in the center, and turning the other round to trace out the circumference. The C. and straight line are the two elements of plane geometry, and those constructions only are regarded as being properly geometrical which can be effected by their means. As an element in plane geometry, its properties are well known and investigated in all the text-books. Only a few of the leading properties will here be stated.

1. Of all plane figures, the C. has the greatest area within the same perimeter.

2. The circumference of a C. bears a certain constant ratio to its diameter. This constant ratio, which mathematicians usually denote by the Greek letter π , has been determined to be 3.14159, nearly, so that, if the diameter of a C. is 1 foot, its circumference is 3.14159 feet; if the diameter is 5 ft., the circumference is 5×3.14159 ; and, in general, if the diameter is expressed by $2r$ (twice the radius), then c (circumference) $= 2r \times \pi$. Archimedes, in his book *De Dimensione Circuli*, first gave a near value to the ratio between the circumference and the diameter, being that of 7 to 22. Various closer approximations in large numbers were afterwards made, as, for instance, the ratio of 1815 to 5702. Vieta, in 1579, showed that if the diameter of a C. be 1000, etc., then the circumference will be greater than 3141.5926535, and less than 3141.5926537. This approximation he made through ascertaining the perimeters of the inscribed and circumscribed polygons of 393,216 sides. By increasing the number of the sides of the polygons, their perimeters are brought more and more nearly into coincidence with the circumference of the circle. The approximation to the value of π has since been carried (by M. de Lagny) to 128 places of figures. It is now settled that π belongs to the class of quantities called *incommensurable* (q.v.), i.e., it cannot be expressed by the ratio of any two whole numbers, however great. In general, it may be considered that 3.14159 is a sufficiently accurate value of π .

Though the value of π was at first approached by actually calculating the perimeter of a polygon of a great number of sides, this operose method was long ago superseded by modes of calculation of a more refined character, which, however, cannot here be explained. Suffice it to say, that various series were formed expressing its value; by taking more and more of the terms of which into account, a closer and closer approach to the value might be obtained. We subjoin one or two of the more curious.

$$\pi = 4 \left(1 - \frac{1}{3} + \frac{1}{5} - \frac{1}{7} + \frac{1}{9} - \frac{1}{11} + \text{etc.} \right).$$

$$\pi = 8 \left(\frac{1}{1.3} + \frac{1}{3.5} - \frac{1}{3.5.7} + \frac{1}{5.7.9} - \frac{1}{7.9.11} + \frac{1}{9.11.13} - \text{etc.} \right).$$

3. The area of a C. is equal to π multiplied by the square of the radius ($= \pi r^2$); or to the square of the diameter multiplied by $\frac{\pi}{4}$; i.e., by .7854. Euclid has proved this

by showing that the area is equal to that of a triangle whose base is the circumference, and perpendicular height the radius of the circle.

4. It follows that different circles are to one another as the squares of their radii or diameters, and that their circumferences are as the radii or diameters.

The C. is almost always employed to measure angles, from its obvious convenience for the purpose, which depends on the fact demonstrated in Euclid (book iv. prop. 33), that angles at the center of a C. are proportional to the arcs on which they stand. It follows, from this, that if circles of the same radii be described from the vertices of angles as centers, the arcs intercepted between the lines, including the angles, are always proportional to the angles. The C. thus presents us with the means of comparing angles. It is first necessary, however, to graduate the C. itself; for this purpose its circumference is divided into four equal parts, called *quadrants*, each of which obviously subtends a right angle at the center, and then each quadrant is divided into degrees, and each degree into minutes, and so on. The systems of graduation adopted are various, and will now be explained.

The *sexagesimal scale* is that in common use. According to it, each quadrant or right angle being divided into 90 degrees, each degree is divided into 60 seconds, and each second into 60 thirds, and so on. According to this scale, 90° represents a right angle; 180°, two right angles, or a semicircle; and 360°, four right angles, or the whole circumference—the unit in the scale being the $\frac{1}{360}$ th of a right angle. As the divisions of the angles at the center, effected by drawing lines from the center to the different points of graduation of the circumference, are obviously independent of the magnitude of the radius, and therefore of the circumference, these divisions of the circumference of the C. may be spoken of as being actually divisions of angles. By laying a graduated C. over an angle, and noticing the number of degrees, etc., lying on the circumference between the lines including the angle, we at once know the magnitude of the angle. Suppose the lines to include between them 3 degrees, 45 minutes, 17 seconds, the angle in this scale would be written 3° 45' 17".

It is obvious, however, that the division of the quadrant into 90 degrees instead of any other number, is quite arbitrary. We may measure angles by the C., however we graduate it. Many French writers, accordingly, have adopted the

Centesimal Division of the Circle.—In this division, the right angle is divided into 100 degrees, while each degree is divided into 100 parts, and so on. This is a most convenient division, as it requires no new notation to denote the different parts. Such a quantity as 3° 45' 17" is expressed in this notation by 3.4517, the only mark required being the decimal point to separate the degrees from the parts. Of course, in this illustration, 3° means 3 centesimal divisions of the right angle, and 45' means 45 centesimal minutes, and so on. If we want to translate the quantity 3° of the common notation into the centesimal notation, we must multiply 3 by 100, and divide by 90. To translate minutes in the common notation into the centesimal, the rule is to multiply by 100, and divide by 54.

There remains yet another mode of measuring angles, known as the

Circular Measure.—The circular measure of angles is in frequent use, and depends directly on the proposition (Euc. vi. 33), that angles at the center of a C. are proportional to the arcs on which they stand. Let POA be an angle at the center O of a C., the radius of which is r ; APB a semicircle whose circumference accordingly = πr ; and let the length of the arc AP = a . Then, by Euclid, $\frac{\text{angle POA}}{2 \text{ right angles}} = \frac{a}{\pi r}$; and

$$\angle POA = \frac{2 \text{ right } \angle s}{\pi} \cdot \frac{a}{r}. \text{ Now, supposing } a \text{ and } r \text{ to be given,}$$

although the angle POA will be determined, yet its numerical value will not be settled unless we make some convention as to what angle we shall call unity. We are free to make any convention we please, and therefore choose such a one as will render the preceding equation the most simple. It is made most simple if we take $\frac{2 \text{ right angles}}{\pi} = 1$. We shall then have (denoting

the numerical value of the angle POA by θ) $\theta = \frac{a}{r}$. The result of our convention is, that the numerical value of two right angles is π , instead of 180°, as in the method of angular measurement first alluded to; and the unit of angle, instead of being the ninetyeth part of a right angle, is $\frac{2 \text{ right angles}}{\pi}$, or 57° 17' 44" 48" nearly. Making $\theta = 1$ in

the equation $\theta = \frac{a}{r}$, we have a (or AP) = r (or AO), which shows that in the circular measure, the unit of angle is that angle which is subtended by an arc of length equal to radius. It is frequently a matter of indifference which mode of measuring angles is adopted; the circular measure, however, is generally the most advantageous, as being the briefest. It is easy to pass from this mode of measurement to the sexagesimal. If

θ be the circular measure of an angle, the angle contains $\frac{\theta}{\pi} \cdot 180^\circ$; conversely, if an angle contain n° , its circular measure is $\frac{n}{180} \cdot \pi$.

CIRCLE, MAGIC, a space in which sorcerers were wont, according to the ancient popular belief, to protect themselves from the fury of the evil spirits they had raised. This C. was usually formed on a piece of ground about 9 ft. square (in the east, 7 ft. appears to have been considered sufficient), in the midst of some dark forest, church-yard, vault, or other lonely and dismal spot. The C. was described at midnight in certain conditions of the moon and weather. Inside the outer C. was another somewhat less, in the center of which the sorcerer had his seat. The spaces between the circles, as well as between the parallel lines which inclosed the larger one, were filled "with all the holy names of God," and a variety of other characters supposed to be potent against the powers of evil. Without the protection of this C., the magician, it was believed, would have been carried off by the spirits, as he would have been, had he by chance got out of the charmed space.

CIRCLE, MURAL, an instrument used for determining the meridian altitude or zenith distance of a star. It consists of an astronomical telescope firmly fixed to a graduated circle, which moves about a horizontal axis, fixed in a strong vertical wall running north and south. In the common focus of the eye-piece and object-glass of the telescope is a system of cross-wires (spider lines are generally used for the purpose), one being horizontal, and five vertical, with equal spaces between. The line joining the optical center of the object-glass with the intersection of the horizontal and middle vertical wires, is called the line of *collimation* of the telescope, and when the instrument is in perfect adjustment, this line moves in the plane of the meridian.

Besides the above-mentioned fixed wire, there is a movable one, called a micrometer wire, which is moved by means of a screw, remaining always parallel to the fixed horizontal wire.

If the instrument be so adjusted that the image of a star, while passing across the middle vertical wire in the field of view, shall at the same time be bisected by the fixed horizontal wire, the star is at that moment in the line of collimation of the telescope. It is therefore at that moment in the meridian, and its meridian zenith distance is the angle through which the circle would have been turned from the position it had when the line of collimation of the telescope pointed to the zenith. There is a fixed pointer, for the purpose of approximately reading the instrument. If the instrument were accurately adjusted, so that the pointer was opposite the zero point of the circle, when the line of collimation of the telescope pointed to the zenith, the arc intercepted between these two positions of the instrument would be the meridian zenith distance of the star.

Great nicety is required in "reading" the instrument; i.e., in determining exactly the arc through which the circle has moved in bringing the telescope from the vertical to any other position. The rim is usually graduated at intervals of five minutes; and the eye could determine only the division nearest to the fixed index. But by means of a "reading microscope," or micrometer (q.v.), fixed opposite to the rim, the portion of the interval to the nearest division on the rim can be read to seconds. There are usually six such microscopes fixed opposite different points of the rim; and the "reading" of the instrument is the mean of the "readings" of all the microscopes. This tends to eliminate errors arising from imperfect graduation and adjustment. If the instrument is properly adjusted, the zero point of the circle will be opposite the fixed pointer when the line of collimation of the telescope points to the zenith. In practice, however, this is not always accurately, or even approximately the case. As we shall immediately show, it is of no consequence, as the final result of every observation is the *difference* between two readings.

It is evident that the difference between any two readings of the instrument will represent the angle through which the line of collimation of the telescope moves in passing from one position to the other. It remains to show how a fixed point, viz., the nadir (q.v.), is observed, and then how an observation is taken of the star itself in its meridian passage.

We must explain here that the fixed horizontal wire in the eye-piece of the telescope, in the instruments as now used, is only an *imaginary* line which determines the line of collimation of the telescope. It coincides with the position of the micrometer wire, when the screw-head of the micrometer marks zero.

To observe the nadir, a trough of mercury is placed underneath the instrument, and the telescope is turned so as to look vertically downwards into it. An image of the system of cross-wires which is in the common focus of the object-glass and eye-piece, will be reflected back again to nearly the same focus. Looking into the telescope, the observer now adjusts it by means of a tangent screw till the reflected image of the horizontal wire coincides with the real one. The final adjustment is perhaps most delicately affected by turning the screw-head of the micrometer which moves the wire itself. When they coincide, the line joining the center of the object-glass of the telescope with

the intersection between the middle vertical and horizontal micrometric wire, will be vertical. Now, the angle between this and the line of collimation of the telescope, which, as we have said, joins the optical center of the object-glass with the intersection of the middle vertical and imaginary fixed horizontal wire, will, if the micrometer is in proper adjustment, be at once read off the micrometer screw-head. The instrument being clamped as above adjusted, the microscopes are read off, and the reading of the micrometer screw-head above mentioned being added to or subtracted from this reading, as the case may be, the nadir reading of the instrument is determined. The zenith reading, therefore, which differs from it by 180° , is at once known.

Again, to observe a star in the meridian, the instrument is previously adjusted so that the star, in passing the meridian, shall pass over the field of view of the telescope. As the image of the star approaches the center of the field, the observer adjusts the telescope by the tangent screw, so as very nearly to bring the image of the star to the horizontal wire. Finally, just as the star passes the middle vertical wire, he bisects the image of the star with the horizontal wire by a touch of the micrometer screw-head. The circle being now clamped (or made fast), the "reading" is determined as before by reading the pointer and microscopes, and adding or subtracting, as the case may be, the reading of the micrometer. This reading now subtracted from the zenith-reading gives the meridian zenith distance of the star; and this, again, subtracted from 90° , gives its meridian altitude above the horizon. See TRANSIT INSTRUMENT.

CIRCLE, QUADRATURE OF. See QUADRATURE.

CIRCLES OF THE SPHERE. See ARMILLARY SPHERE.

CIRCLEVILLE, a city and co. seat of Pickaway co., Ohio, on the Scioto river, the Ohio canal, and the Cincinnati and Muskingum Valley, and the Norfolk and Western railroads; 25 miles s. of Columbus. It was laid out in 1810 on the site of a circular fortification, built by some ancient people, and from which the name is taken. The fort is described in Howe's History of Ohio. The city contains churches, national banks, a high school, and union schools, public library, and daily and weekly newspapers, and has excellent water power, electric lights and electric street railroads. The chief industry is pork-packing; there are also large straw-board works, and great quantities of broom corn are raised in the vicinity. Pop, '90, 6556.

CIRCUIT. See ELECTRICITY.

CIRCUIT COURT, in American jurisprudence, a court whose jurisdiction extends over a number of counties or districts, and which holds its sittings in various places within the jurisdiction. More definitely, a class of federal courts of which the terms are held in two or more places successively in the various circuits into which the whole union is divided. They are presided over by the chief-justice of the U. S., or one of the associate judges, or by a special circuit justice, or in some cases by a district judge. The C. C. has jurisdiction in law and equity, direct and appellate; hears appeals in admiralty, and in some instances in criminal cases. The systems respecting circuit courts in the several states differ considerably.

CIRCUITS (Fr. *circuit*; Lat. *circuitus*, a going round). In ENGLAND.—England and Wales, with the exception of the co. of Middlesex, are divided, for judicial purposes, into eight C., which the 15 judges visit twice or thrice a year, in pairs, for the purpose of adjudging civil and criminal causes. These C. are the Home, the Midland, the Norfolk, the Oxford, the Northern, the Western, the North Wales, and the South Wales. Criminal charges within the co. of Middlesex and the city of London and surrounding district, are disposed of at sessions which are held monthly at the central criminal court. Before and after term, the judges of the superior courts sit for the adjudication of civil causes in the Guildhall of the city of London, with the exception of the lord chancellor and the vice-chancellor, who sit at Lincoln's Inn. "These judges of assize came into use in the room of the ancient justices in eyre, *justiciarii in itinere*, who were regularly established, if not first appointed, by the parliament of Northampton, 1176 A.D., in the twenty-second year of Henry II., with a delegated power from the king's great court, or *aula regia*, being looked upon as members thereof."—Stephen's *Com.*, vol. iii. p. 415. See ASSIZE and NISI PRIUS.—IRELAND is divided into six circuits.

CIRCULAR NOTES are bank-notes specially adapted for the use of travelers in foreign countries; and being, in fact, bills personal to the bearer, they are believed to be more safe as traveling money than ordinary notes or coin. C. N. are furnished by the chief London banking-houses. Those who wish to obtain them, determine beforehand what sum of money they will require on their journey, and that they pay to the banker, who, in exchange, gives C. N. to the amount, each of the value of £10 and upwards. Along with these notes is given a "letter of indication." This letter (a lithographed form in French) is addressed to foreign bankers, requesting them to pay the notes presented by the bearer, whom they name, and to aid him in any way in their power. By way of verification, the bearer appends his signature, and the letter is complete. On the back of the letter there is a long list of foreign bankers, extending all over Europe, any of whom will cash one or more of the C. N., on being presented and indorsed by the bearer; the indorsement being of course compared with the signature on the letter of indication, which is at the same time exhibited. In paying these notes, the money

of the country is given, according to the course of exchange, and free of any charge for commission. For security, the letter and the notes should not be carried together, in case of being stolen or lost. These C. N. are doubtless a safe and convenient species of money, exchangeable in almost every town visited; and if any remain over on coming home, they will be taken back at their value by the banker who issued them. There are, however, certain drawbacks connected with these notes, which every traveler less or more experienced. In many, almost in all, instances, there is a difficulty in finding out where the banker named is to be found; for foreign bankers generally occupy obscure apartments several stories high, and not unusually in dingy out-of-the-way alleys. To discover them, a commissionaire may be necessary. Then, in some instances (in Paris invariably), the banker jealously scrutinizes the bearer, asks to see his passport, and takes a note of the hotel at which he lodges; all which may be proper as a precaution against roguery, but it is not pleasant. Further, the C. N. are ordinarily of a thick stiff kind of paper, which does not well fit into a purse or pocket-book. On these several accounts, the careful class of travelers who keep to the main thoroughfares of France, Germany, and Belgium, will find £5 or £10 bank of England notes, and sovereigns or napoleons, a preferable kind of money. See CHEQUE BANK.

CIRCULAR NUMBERS are numbers whose powers end on the same figure as they do themselves: such are numbers ending in 0, 1, 5, 6.

CIRCULAR PARTS, the name given to a rule in spherical trigonometry, invented by lord Napier. It is to be found in any treatise on that subject.

CIRCULATING DECIMALS, decimal fractions in which the same figures or series of figures constantly recur; also called circulatory, recurring, or repeating decimals.

CIRCULATING LIBRARY, a collection of books lent out on hire—circulated from hand to hand. The plan of lending books on hire is not new. Chevillier, in his *Origines de l'Imprimerie de Paris* (4to, 1694), mentions that, in 1342, a century before the invention of printing, a law was framed in Paris, to compel stationers to keep books to be lent on hire, for the special benefit of poor students and others. This fact is alluded to as follows, by E. S. Merryweather, in his entertaining work, *Bibliomania in the Middle Ages* (London, 1849): "The reader will be surprised at the idea of a circulating library in the middle ages, but there can be no doubt of the fact, they were established at Paris, Toulouse, Vienna, and other places. These public librarians, too, were obliged to write out regular catalogues of their books, and hang them up in their shops, with the prices affixed, so that the student might know beforehand what he had to pay for reading them." This writer, quoting from Chevillier, gives a list of books so lent out, with the prices for reading them. The books are all of a theological or classical kind. Among them is the Bible, the perusal of which is set down at 10 sous. "This rate of charge," it is added, "was also fixed by the university, and the students borrowing these books were privileged to transcribe them, if they chose; if any of them proved imperfect or faulty, they were denounced by the university, and a fine was imposed upon the bookseller who had lent out the volume." In these arrangements, we see the efforts that were made to procure the use of books before the art of printing had cheapened the cost of literature.

By whom the modern C. L. was projected, there is no record. All that can be given are a few facts on the subject. It is known that Allan Ramsay, author of *The Gentle Shepherd*, who was a bookseller in Edinburgh, established a C. L. in that city about 1725. Fond of dramatic literature, Ramsay appears to have incurred some local obloquy by lending out plays; and his wish to introduce a taste for the drama into Edinburgh may accordingly have suggested the notion of a circulating library. Be this as it may, the library which he began was continued through various hands for above a hundred years. At Ramsay's death in 1758, his library was sold to a Mr. Yair, whose widow carried it on till 1780, when it was bought by Mr. James Sibbald, an ingenious inquirer into Scottish literary antiquities. Sibbald lived some years as a literary man in London, during which period, beginning with 1793, the C. L. was carried on, subject to an agreement by a Mr. Laurie. Sibbald afterwards resumed the direction of the library, which he considerably extended. At his death in 1803, his brother attempted to carry it on; but not being successful in his management, he disposed of it in 1806 to Alexander Mackay, a person of extraordinary energy and perseverance. By the acquisition of various other libraries, Mr. Mackay greatly enlarged the collection, which, under the name of the Edinburgh C. L., he conducted at 154 High street. Here, by long-continued and minute attention to business, Mr. Mackay realized a competency, and he retired from active pursuits in 1831.

There are several circulating libraries in London, claiming to be of old date, but probably not so early as 1725. In a late reprint of an old advertisement, we see "Proposals for erecting a public circulating library in London," under date June 12, 1742. This library was to be established "in some convenient place at or near the royal exchange;" and the subscription was to be a guinea per annum. Two of the present circulating libraries are believed to be descended from this primitive stock. So numerous had circulating libraries become in the early years of the present century, that they absorbed whole editions of novels and romances prepared for the purpose by a London
